## Legal information

### Warning concept

This Manual contains information which you must observe to ensure your own personal safety as well as to avoid material damage. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to equipment damage have no safety alert symbol. Depending on the hazard level, warnings are indicated in a descending order as follows:

 <b>DANGER</b>
indicates that death or serious injury <b>will</b> result if proper precautions are not taken.
 <b>WARNING</b>
indicates that death or serious injury <b>could</b> result if proper precautions are not taken.
 <b>CAUTION</b>
indicates that minor personal injury can result if proper precautions are not taken.
<b>NOTICE</b>
indicates that property damage can result if proper precautions are not taken.

If more than one level of danger is simultaneously applicable, the warning notice for the highest level is used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified personnel

The product/system described in this documentation may only be operated by **personnel qualified** for the specific task in accordance with the relevant documentation for the specific task, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

 <b>WARNING</b>
Siemens products are only permitted to be used for the applications envisaged in the catalog and in the associated technical documentation. If third-party products and components are to be used, they must be recommended or approved by Siemens. These products can only function correctly and safely if they are transported, stored, set up, mounted, installed, commissioned, operated and maintained correctly. The permissible ambient conditions must be adhered to. Information in the associated documentation must be observed.

### Trademarks

All names identified with ® are registered trademarks of Siemens AG. Any other names used in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of liability

We have verified that the contents of this document correspond to the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. The information given in this document is reviewed at regular intervals and any corrections that might be necessary are made in the subsequent editions.

### Content

1.1	General safety instructions	8
1.2	Industrial security	9

## 1.1 General safety instructions

### **WARNING**

#### **Risk of death if the safety instructions and remaining risks are not carefully observed**

If the safety instructions and residual risks are not observed in the associated hardware documentation, accidents involving severe injuries or death can occur.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

### **WARNING**

#### **Danger to life or malfunctions of the machine as a result of incorrect or changed parameterization**

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization (parameter assignments) against unauthorized access.
- Respond to possible malfunctions by applying suitable measures (e.g. EMERGENCY-STOP or EMERGENCY-OFF).

## 1.2 Industrial security

---

### Note

#### Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, devices, and/or networks. They are important components of a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

To ensure that Siemens products and solutions are operated securely, suitable preventive measures (e.g. cell protection concept) and each component must be integrated into a state-of-the-art holistic industrial security concept. Third-party products that may be in use should also be considered. You will find more information about industrial security at:

<http://www.siemens.com/industrialsecurity>

To receive information about product updates on a regular basis, register for our product newsletter. You will find more information at:

<http://support.automation.siemens.com>

---

### WARNING

#### Danger as a result of unsafe operating states resulting from software manipulation

Software manipulation (e.g. by viruses, Trojan horses, malware, worms) can cause unsafe operating states to develop in your installation which can result in death, severe injuries and/or material damage.

- Keep the software up to date.

Information and newsletters can be found at:

<http://support.automation.siemens.com>

- Incorporate the automation and drive components into a holistic, state-of-the-art industrial security concept for the installation or machine.

For more information, visit:

<http://www.siemens.com/industrialsecurity>

- Make sure that you include all installed products into the holistic industrial security concept.

## 2.1 Overview of parameters

### 2.1.1 Explanation of the parameter list

#### Basic structure of the parameter descriptions

The data in the following example have been chosen at random. The table below contains all the information that can be included in a parameter description. Some of the information is optional.

The "List of parameters" (Page 25) has the following structure:

----- **Start of example** -----

----- **End of example** -----

The individual pieces of information are described in detail below.

**pxxxx[0...n]      Parameter number**

The parameter number is made up of a "p" or "r", followed by the parameter number and the index or bit field (optional).

Examples of the representation in the parameter list:

- p...                      Adjustable parameters (read and write)
- r...                      Display parameters (read only)
- p0918                    Adjustable parameter 918
- p2051[0...13]        Adjustable parameter 2051, indices 0 to 13
- p1001[0...n]        Adjustable parameter 1001, indices 0 to n (n = configurable)
- r0944                    Display parameter 944
- r2129.0...15        Display parameter 2129 with bit field from bit 0 (smallest bit) to bit 15 (largest bit)

Other examples of notation in the documentation:

- p1070[1]              Adjustable parameter 1070, index 1
- p2098[1].3          Adjustable parameter 2098, index 1 bit 3
- p0795.4              Adjustable parameter 795, bit 4

The following applies to adjustable parameters:

The parameter value as delivered is specified under "Factory setting" with the relevant unit in square brackets. The value can be adjusted within the range defined by "Min" and "Max".

The term "linked parameterization" is used in cases where changes to adjustable parameters affect the settings of other parameters.

Linked parameterization can occur, for example, as a result of the following actions and parameters:

- Setting the PROFIBUS telegram (BICO interconnection)  
p0922
- Setting component lists  
p0230, p0300, p0301, p0400
- Automatically calculating and pre-assigning  
p0340, p3900
- Restoring the factory settings  
p0970

The following applies to display parameters:

The fields "Min", "Max" and "Factory setting" are specified with a dash "-" and the relevant unit in square parentheses.

**Note**

The parameter list can contain parameters that are not visible in the expert lists of the particular commissioning software (e.g. parameters for trace functions).

**BICO: Full parameter name/Abbreviated name**

The following abbreviations can appear in front of the BICO parameter name:

- **BI:** Binector Input  
This parameter is used for selecting the source of a digital signal.
- **BO:** Binector Output  
This parameter is available as a digital signal for interconnection with other parameters.
- **CI:** Connector Input  
This parameter is used for selecting the source of an "analog" signal.
- **CO:** Connector Output  
This parameter is available as an "analog" signal for interconnection with other parameters.
- **CO/BO:** Connector/Binector Output  
This parameter is available as an "analog" and digital signal for interconnection with other parameters.

**Note**

A BICO input (BI/CI) cannot be interconnected with just any BICO output (BO/CO, signal source).

When interconnecting a BICO input using the commissioning software, only the corresponding possible signal sources are listed.

Function diagrams 1020 ... 1030 explain the symbols for BICO parameters and how to deal with BICO technology.

**CU/PM variants**

Specifies the Control Unit (CU) for which the parameter is valid. If no CU is listed, then the parameter is valid for all variants.

The following information about "CU" can be displayed under the parameter number:

Table 2-1 Information in the "CU variants" field

CU/PM variants	Meaning
	All Control Units have this parameter.
CU250S_V	CU250S-2, vector control mode and USS fieldbus interface
CU250S_V_CAN	CU250S-2 with vector control mode and CAN interface and
CU250S_V_DP	CU250S-2 with vector control mode and PROFIBUS interface
CU250S_V_PN	CU250S-2 with vector control mode and PROFINET interface
PM240	Power Module for standard applications with dynamic braking (3 AC 400 V)
PM240-2	Power Module for standard applications with dynamic braking (1 AC / 3 AC 200 V; 3 AC 400 V; 3 AC 600 V)
PM250	Power Module (3 AC 400 V with energy recovery)
PM260	Power Module (3 AC 690 V with energy recovery)
PM340	Power Module for standard applications with dynamic braking (1 AC 200 V)

### Access level

Specifies the minimum access level required to be able to display and change the relevant parameter. The required access level can be set using p0003.

The system uses the following access levels:

- 1: Standard (not adjustable, included in p0003 = 3)
- 2: Extended (not adjustable, included in p0003 = 3)
- 3: Expert
- 4: Service

Parameters with this access level are password protected.

---

#### Note

Parameter p0003 is CU-specific (belongs to the Control Unit).

A higher access level will also include the functions of the lower levels.

---

### Calculated

Specifies whether the parameter is influenced by automatic calculations.

p0340 determines which calculations are to be performed:

- p0340 = 1 includes the calculations from p0340 = 2, 3, 4, 5.
- p0340 = 2 calculates the motor parameters (p0350 ... p0360, p0625).
- p0340 = 3 includes the calculations from p0340 = 4, 5.
- p0340 = 4 only calculates the controller parameters.
- p0340 = 5 only calculates the controller limits.

---

#### Note

For p3900 > 0, p0340 = 1 is also called automatically.

After p1900 = 1, 2, p0340 = 3 is also called automatically.

---

Parameters with a reference to p0340 after "Calculated" depend on the Power Module being used and the motor. In this case, the values at "Factory setting" do not correspond to the actual values because these values are calculated during the commissioning. This also applies to the motor parameters.

**Data type**

The information on the data type can consist of the following two items (separated by a slash):

- First item  
Data type of the parameter.
- Second item (for binector or connector input only)  
Data type of the signal source to be interconnected (binector-/connector output).

Parameters can have the following data types:

- Integer8                    I8            8-bit integer number
- Integer16                  I16           16-bit integer number
- Integer32                  I32           32-bit integer number
- Unsigned8                  U8            8 bits without sign
- Unsigned16                U16           16 bits without sign
- Unsigned32                U32           32 bits without sign
- FloatingPoint32        Float        32-bit floating point number

Depending on the data type of the BICO input parameter (signal sink) and BICO output parameter (signal source), the following combinations are possible when creating BICO interconnections:

Table 2-2 Possible combinations of BICO interconnections

BICO output parameter	BICO input parameter			
	CI parameter			BI parameter
	Unsigned32 / Integer16	Unsigned32 / Integer32	Unsigned32 / FloatingPoint32	Unsigned32 / Binary
CO: Unsigned8	x	x	–	–
CO: Unsigned16	x	x	–	–
CO: Unsigned32	x	x	–	–
CO: Integer16	x	x	r2050	–
CO: Integer32	x	x	r2060	–
CO: FloatingPoint32	x	x	x	–
BO: Unsigned8	–	–	–	x
BO: Unsigned16	–	–	–	x
BO: Unsigned32	–	–	–	x
BO: Integer16	–	–	–	x
BO: Integer32	–	–	–	x
BO: FloatingPoint32	–	–	–	–
Legend:                    x : BICO interconnection permitted –: BICO interconnection not permitted rxxxx: BICO interconnection is only permitted for the specified CO parameters				

## Can be changed

The "-" sign indicates that the parameter can be changed in any object state and that the change will be effective immediately.

The information "C(x), T, U" ((x): optional) means that the parameter can be changed only in the specified drive unit state and that the change will not take effect until the unit switches to another state. This can be a single state or multiple states.

The following states are available:

- C(x) commissioning C: Commissioning  
 Drive commissioning is in progress (p0010 > 0).  
 Pulses cannot be enabled.  
 The parameter can only be changed in the following drive commissioning settings (p0010 > 0):
  - C: Can be changed for all settings p0010 > 0.
  - C(x): Can only be changed for the settings p0010 = x.
 A modified parameter value does not take effect until drive commissioning mode is exited with p0010 = 0.
- U Operation U: Run  
 Pulses are enabled.
- T Ready T: Ready to run  
 The pulses are not enabled and the status "C(x)" is not active.

## Scaling

Specification of the reference variable with which a signal value is automatically converted for a BICO interconnection.

The following reference variables are available:

- p2000 ... p2007: Reference speed, reference voltage, etc.
- PERCENT: 1.0 = 100 %
- 4000H: 4000 hex = 100 % (word) or 4000 0000 hex = 100 % (double word)
- p0514: specific normalization

Refer to the description for p0514[0...9] and p0515[0...19] to p0524[0...19]

**Dyn. index (dynamic index)**

For parameters with a dynamic index [0...n], the following information is specified here:

- Data set (if available).
- Parameter for the number of indices (n = number - 1).

The following information can be contained in this field:

- "CDS, p0170" (Command Data Set, CDS count)

Example:

p1070[0] → main setpoint [command data set 0]

p1070[1] → main setpoint [command data set 1], etc.

- "DDS, p0180" (Drive Data Set, DDS count)
- "EDS, p0140" (Encoder Data Set, EDS count)
- "MDS, p0130" (Motor Data Set, MDS count)
- "PDS, p0120" (Power unit Data Set, PDS count)

Data sets can only be created and deleted when p0010 = 15.

**Note**

Information on the data sets can be taken from the following references:

- Operating Instructions SINAMICS G120 Frequency Inverter with CU250S-2 Control Units.

**Unit group and unit selection**

The standard unit of a parameter is specified in square brackets after the values for "Min", "Max", and "Factory setting".

For parameters where the unit can be switched over, the specifications for "Unit group" and "Unit selection" determine the group to which this parameter belongs and with which parameter the unit can be changed over.

**Example:**

Unit group: 7\_1, unit selection: p0505

The parameter belongs to unit group 7\_1 and the unit can be changed over using p0505.

All the potential unit groups and possible unit selections are listed below.

Table 2-3 Unit group (p0100)

### Function diagram

The parameter is included in this function diagram. The structure of the parameter function and its relationship with other parameters is shown in the specified function diagram.

### Parameter values

Min.	Minimum value of the parameter [unit]
Max	Maximum value of the parameter [unit]
Factory setting	Value when delivered [unit]  In the case of a binector/connector input, the signal source of the default BICO interconnection is specified. A non-indexed connector output is assigned the index [0].  A different value may be displayed for certain parameters (e.g. p1800) at the initial commissioning stage or when establishing the factory settings. Reason: The setting of these parameters is determined by the operating environment of the Control Unit (e.g. depending on converter type, power unit).

### Description

Explanation of the function of a parameter

### Values

Lists the possible values of a parameter.

### Recommendation

Information about recommended settings.

### Index

The name and meaning of each individual index is specified for indexed parameters.

The following applies to the values (Min, Max, Factory setting) of indexed adjustable parameters:

- Min, Max:  
The adjustment range and unit apply to all indices.
- Factory setting:  
When all indices have the same factory setting, index 0 is specified with the unit to represent all indices.  
When the indices have different factory settings, they are all listed individually with the unit.

## Bit field

For parameters with bit fields, the following information is provided about each bit:

- Bit number and signal name
- Meaning for signal states 0 and 1
- Function diagram (FP) (optional).

The signal is shown on this function diagram.

## Dependency

Conditions that must be fulfilled in conjunction with this parameter. Also includes special effects that can occur between this parameter and others.

Where necessary, "Refer to:" indicates the following information:

- List of other relevant parameters to be considered.
- List of faults and alarms to be considered.

## Safety guidelines

Important information that must be observed to avoid the risk of physical injury or material damage.

Information that must be observed to avoid any problems.

Information that the user may find useful.

## 2.1.2 Number ranges of parameters

### Note

The following number ranges represent an overview for all the parameters available for the SINAMICS drive family.

The parameters for the product described in this List Manual are described in detail in "List of parameters" (Page 25).

Parameters are grouped into the following number ranges:

Table 2-6 Number ranges for SINAMICS

Range		Description

**Description:**

Operating display for the drive.

**Value:**

0: Operation - everything enabled  
 10: Operation - set "enable setpoint" = "1" (p1142, p1152)  
 11: Operation - set "enable speed controller" = "1" (p0856)  
 12: Operation - RFG frozen, set "RFG start" = "1" (p1141)  
 13: Operation - set "enable RFG" = "1" (p1140)  
 14: Oper. - MotID, excit. running and/or brake opens, SS2, STOP C  
 15: Operation - open brake (p1215)  
 16: Operation - withdraw braking with OFF1 using "ON/OFF1" = "1"  
 17: Operation - braking with OFF3 can only be interrupted with OFF2  
 18: Operation - brake on fault, remove fault, acknowledge  
 19: Operation - armature short-circ./DC brake act. (p1230, p1231)  
 21: Ready for operation - set "Operation enable" = "1" (p0852)  
 22: Ready for operation - de-magnetizing running (p0347)  
 23: Ready for operation - set "Infeed operation" = "1" (p0864)  
 31: Ready for switching on - set "ON/OFF1" = "0/1" (p0840)  
 35: Switching-on inhibited - carry out first commissioning (p0010)  
 41: Switching-on inhibited - set "ON/OFF1" = "0" (p0840)  
 42: Switching-on inhibited - set "OC/OFF2" = "1" (p0844, p0845)  
 43: Switching-on inhibited - set "OC/OFF3" = "1" (p0848, p0849)  
 44: Switching-on inhibited - supply STO terminal w/ 24 V (hardware)  
 45: Switching-on inhibited - rectify fault, acknowledge fault, STO  
 46: Switching-on inhibited - exit commissioning mode (p0009, p0010)  
 60: Drive object de-activated/not operational  
 70: Initialization  
 200: Wait for booting/partial booting  
 250: Device signals a topology error

**Dependency:**

Refer to: r0046

**Notice:**

For several missing enable signals, the corresponding value with the highest number is displayed.

**Note:**

OC: Operating condition  
 EP: Enable Pulses (pulse enable)  
 RFG: Ramp-function generator  
 COMM: Commissioning  
 MotID: Motor data identification  
 SS2: Safe Stop 2  
 STO: Safe Torque Off

**Description:**

Sets the access level to read and write parameters.

**Value:**

3: Expert  
 4: Service

## 2 Parameters

### 2.2 List of parameters

**Note:** A higher set access level also includes the lower one.  
Access level 3 (experts):  
Expert know-how is required for these parameters (e.g. BICO parameterization).  
Access level 4 (service):  
For these parameters, it is necessary that authorized service personnel enter the appropriate password (p3950).

<b>p0010</b>	<b>Drive commissioning parameter filter / Drv comm. par_filt</b>		
<b>Access level:</b> 1	<b>Calculated:</b> -	<b>Data type:</b> Integer16	
<b>Can be changed:</b> C(1), T	<b>Scaling:</b> -	<b>Dyn. index:</b> -	
<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 2800, 2818	
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
0	95	1	

**Description:** Sets the parameter filter to commission a drive.  
Setting this parameter filters out the parameters that can be written into in the various commissioning steps.

**Value:**

- 0: Ready
- 1: Quick commissioning
- 2: Power unit commissioning
- 3: Motor commissioning
- 4: Encoder commissioning
- 5: Technological application/units
- 11: Function modules
- 15: Data sets
- 17: Basic positioner commissioning
- 25: Position control commissioning
- 29: Only Siemens int
- 30: Parameter reset
- 39: Only Siemens int
- 49: Only Siemens int
- 95: Safety Integrated commissioning

**Dependency:** Refer to: r3996

**Note:** The drive can only be switched on outside the drive commissioning (inverter enable). To realize this, this parameter must be set to 0.  
By setting p3900 to a value other than 0, the quick commissioning is completed, and this parameter is automatically reset to 0.  
Procedure for "Reset parameter": Set p0010 to 30 and p0970 to 1.

<b>p0014</b>	<b>Buffer memory mode / Buf mem mode</b>		
<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> Integer16	
<b>Can be changed:</b> U, T	<b>Scaling:</b> -	<b>Dyn. index:</b> -	
<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -	
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
0	2	0	

**Description:** Sets the mode for the buffer memory.

**Value:**

- 0: Save in a non-volatile fashion (RAM)
- 1: Buffer memory active (non-volatile)
- 2: Clear buffer memory

**Dependency:** If p0014 = 1, changes in the same parameter, as well as in following parameters will not be copied to the buffer memory:  
Refer to: p0015, p0040, p0108, p0340, p0650, p0802, p0803, p0804, p0952, p0969, p0970, p0971, p0972, p1900, p1910, p1960, p2111, p3900, p3981, p7759, p7761, p7762, p7763, p7764, p7765, p7766, p7767, p7768, p7769, p7775, p8611  
Refer to: A01066, A01067

- Notice:** For p0014 = 1:  
The following applies if a memory card is optionally inserted:
- the data in the buffer memory are not automatically written to the memory card.
  - when switching off/switching on, a possibly valid parameter set is loaded from the memory card.
  - remedy: manually save the parameters before switching off the Control Unit (e.g.. p0971 = 1).
- For p0014 = 2:  
- with this delete operation, entries in the buffer memory are lost and cannot be retrieved.
- In general:  
- after the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.
- Note:** The parameter is not influenced by setting the factory setting.
- For p0014 = 0:  
Parameter changes are saved in the volatile memory (RAM).  
Non-volatile storage from RAM to ROM is carried out in the following cases:
- p0971 = 1
  - change from p0014 = 0 to 1
- For p0014 = 1:  
With this setting, alarm A01066 followed by alarm A01067 can occur if parameters are continually changed via a fieldbus system.  
Parameter changes are entered in the volatile memory (RAM) and also in the non-volatile buffer memory.  
In the following cases, the entries in the buffer memory are transferred into the ROM and then the buffer memory is cleared:
- p0971 = 1
  - switch off/switch on the Control Unit
  - change from p0014 = 1 to 0
- For p0014 = 2:  
The procedure to clear the entries in the buffer memory is initiated.  
p0014 is automatically set to 0 after the entries have been cleared.

	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 6799
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	- [V]	- [V]	- [V]
<b>Description:</b>	Displays the smoothed actual value of the DC link voltage.		
<b>Dependency:</b>	Refer to: r0070		
<b>Notice:</b>	When measuring a DC link voltage < 200 V, for the Power Module a valid measured value is not supplied. In this case, when an external 24 V power supply is connected, a value of approx. 24 V is displayed in the display parameter.		
<b>Note:</b>	Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The DC link voltage is available smoothed (r0026) and unsmoothed (r0070). r0026 sets itself to the lower value of the pulsating DC link voltage.		
<b>r0027</b>	<b>CO: Absolute actual current smoothed / I_act abs val smth</b>

	- [Arms]	- [Arms]	- [Arms]
<b>Description:</b>	Displays the smoothed absolute actual current value.		
<b>Dependency:</b>	Refer to: r0068		
<b>Notice:</b>	This smoothed signal is not suitable for diagnostics or evaluation of dynamic operations. In this case, the unsmoothed value should be used.		

## 2 Parameters

### 2.2 List of parameters

**Note:** Smoothing time constant = 300 ms  
The signal is not suitable as a process quantity and may only be used as a display quantity.  
The absolute current actual value is available smoothed (r0027) and unsmoothed (r0068).

<b>Description:</b>	Display and connector output for the motor utilization from motor temperature model 1 (I2t) or 3. For motor temperature model 1 (I2t) (p0612.0 = 1), the following applies: For firmware version < 4.7 SP6 or p0612.12 = 0: - r0034 = (motor model temperature - 40 K) / (p0605 - 40 K) * 100 % From firmware version 4.7 SP6 and p0612.12 = 1: - r0034 = (motor model temperature - p0613) / (p0605 - p0613) * 100 % For motor temperature model 3 (p0612.2 = 1), the following applies: - r0034 = (motor model temperature - p5397) / (p5398 - p5397) * 100 %		

## 2 Parameters

### 2.2 List of parameters

- Dependency:** The thermal motor utilization is only determined when the motor temperature model 1 (I2t) or 3 is activated. The following conditions are a prerequisite for additional information.
- a temperature sensor has not been parameterized (p0600, p0601).
  - the current corresponds to the stall current (p0318).
  - speed  $n > 1$  [rpm].
- For firmware version  $< 4.7$  SP6 or  $p0612.12 = 0$ , the following applies:
- the temperature model operates with an ambient temperature of  $20\text{ °C}$ .
- A motor utilization of 100% is displayed ( $r0034 = 100\%$ ) when the following conditions are permanently fulfilled:
- the ambient temperature is  $40\text{ °C}$  (model 1:  $p0625 = 40\text{ °C}$ , model 3:  $p0613 = 40\text{ °C}$ ).
- From firmware version 4.7 SP6 and  $p0612.12 = 1$ , the following applies:
- the ambient temperature can be adapted to the conditions using p0613.
- Refer to: p0605, p0611, p0612, p0613, p0627, r0632  
Refer to: F07011, A07012
- Notice:** After the drive is switched on, the system starts to determine the motor temperature with an assumed model value. This means that the value for the motor utilization is only valid after a stabilization time.
- Note:** Smoothing time constant = 100 ms  
The signal is not suitable as a process quantity and may only be used as a display quantity.  
For  $r0034 = -200.0\%$ , the following applies:  
The value is invalid (e.g. the motor temperature model is not activated or has been incorrectly parameterized).

**Note:**

- For  $r0035$  not equal to  $-200.0\text{ °C}$ , the following applies:
- this temperature display is valid.
  - a KTY/PT1000 temperature sensor is connected.
  - the thermal model for the induction motor is activated ( $p0612$  bit 1 = 1 and temperature sensor de-activated:  $p0600 = 0$  or  $p0601 = 0$ ).
- For  $r0035$  equal to  $-200.0\text{ °C}$ , the following applies:
- this temperature display is not valid (temperature sensor error).
  - a PTC sensor or bimetallic NC contact is connected.
  - the temperature sensor of the synchronous motor is de-activated ( $p0600 = 0$  or  $p0601 = 0$ ).

**Description:**

Displays the power unit overload determined using the I2t calculation.  
A current reference value is defined for the I2t monitoring of the power unit. It represents the current that can be conducted by the power unit without any influence of the switching losses (e.g. the continuously permissible current of the capacitors, inductances, busbars, etc.).

If the I2t reference current of the power unit is not exceeded, then an overload (0 %) is not displayed.

In the other case, the degree of thermal overload is calculated, whereby 100% results in a trip.

- there is a "switching-on inhibited".

Bit 01 = 1 (enable signal missing), if:

- the signal source in p0844 or p0845 is a 0 signal.

Bit 02 = 1 (enable signal missing), if:

- the signal source in p0848 or p0849 is a 0 signal.

- Bit 03 = 1 (enable signal missing), if:
- the signal source in p0852 is a 0 signal.
- Bit 04 = 1 (armature short-circuit active), if:
- the signal source in p1230 has a 1 signal.
- Bit 05, Bit 06: Being prepared
- Bit 08 = 1 (enable signal missing), if:
- safety functions have been enabled and STO is active.
  - STO is selected via onboard terminals or PROFIsafe.
  - a safety-relevant signal is present with STOP A response.
  - the "STO via terminals at the Power Module" function is selected.
- Bit 09 = 1 (enable signal missing), if:
- the signal source in p0864 is a 0 signal.
- Bit 10 = 1 (enable signal missing), if:
- the signal source in p1140 is a 0 signal.
- Bit 11 = 1 (enable signal missing) if the speed setpoint is frozen, because:
- the signal source in p1141 is a 0 signal.
  - the speed setpoint is entered from jogging and the two signal sources for jogging, bit 0 (p1055) and bit 1 (p1056) have a 1 signal.
- Bit 12 = 1 (enable signal missing), if:
- the signal source in p1142 is a 0 signal.
  - When activating the function module "basic positioner" (r0108.4 = 1), the signal source in p1142 is set to a 0 signal.
- Bit 16 = 1 (enable signal missing), if:
- there is an OFF1 fault response. The system is only enabled if the fault is removed and was acknowledged and the "switching-on inhibited" withdrawn with OFF1 = 0.
- Bit 17 = 1 (enable signal missing), if:
- commissioning mode is selected (p0010 > 0).
  - there is an OFF2 fault response.
  - the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).
- Bit 18 = 1 (enable signal missing), if:
- OFF3 has still not been completed or an OFF3 fault response is present.
- Bit 19 = 1 (internal pulse enable missing), if:
- synchronization is running between the basic clock cycle, DRIVE-CLiQ clock cycle and application clock cycle.
- Bit 20 = 1 (internal armature short-circuit active), if:
- the drive is not in the state "S4: Operation" or "S5x" (refer to function diagram 2610).
  - the internal pulse enable is missing (r0046.19 = 0).
- Bit 21 = 1 (enable signal missing), if:
- The pulses have been enabled and the speed setpoint has still not been enabled, because:
- the holding brake opening time (p1216) has still not expired.
  - the motor has still not been magnetized (induction motor).
  - the encoder has not been calibrated (U/f vector and synchronous motor).
- Bit 22: Being prepared
- Bit 26 = 1 (enable signal missing), if:
- the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).
  - the function "parking axis" is selected (BI: p0897 = 1 signal)..
  - all power units of a parallel connection are de-activated (p0125, p0895).
- Bit 27 = 1 (enable signal missing), if:
- de-magnetizing has still not been completed (only for vector).
- Bit 28 = 1 (enable signal missing), if:
- the holding brake is closed or has still not been opened.
- Bit 29 = 1 (enable signal missing), if:
- the cooling unit ready signal via binector input p0266[1] missing.

Bit 30 = 1 (speed controller inhibited), if one of the following reasons is present:

- a 0 signal is available via binector input p0856.
- the function generator with current input is active.
- the measuring function "current controller reference frequency characteristic" is active.
- the pole position identification is active.
- motor data identification is active (only certain steps).

Bit 31 = 1 (enable signal missing), if:

- the speed setpoint from jog 1 or 2 is entered.

<b>Description:</b>	Setting the commissioning and control view for various application classes.		
<b>Value:</b>	0: Expert 1: Standard Drive Control (SDC) 2: Dynamic Drive Control (DDC)		
<b>Dependency:</b>	The parameter is preset when commissioning the system for the first time and for the factory setting, depending on the power unit that is connected. Depending on the setting, the ability to see control parameters is restricted depending on the particular application. The following applies for p0096 > 0: The motor data identification routine is preset (p1900 = 12). After the motor data identification, the system immediately goes into operation. The following applies for p0096 = 1: The motor type (p0300) synchronous or reluctance motor is not possible.		
<b>Note:</b>	When changing p0096 to 1 or 2, when completing commissioning, fast parameterization should be executed (p3900 > 0). Depending on the setting, after quick commissioning and/or automatic parameterization, the procedure for motor data identification as well as the setting of the operating mode and parameterization of the closed-loop control must be appropriately adapted.

	-	-	0000 bin	
<b>Description:</b>	Configuration of the motor when commissioning the motor.			
<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>
	00	Motor connection type	Delta	Star
	01	Motor 87 Hz operation	Yes	No
<b>Dependency:</b>	For standard induction motors (p0301 > 10000), bit 0 is automatically pre-assigned the connection type of the selected data set. For p0100 > 0 (60 Hz rated motor frequency), it is not possible to select bit 1. Refer to: p0304, p0305, p1082			
<b>Note:</b>	For bit 00: When changing the bits, the rated motor voltage p0304 and the rated motor current p0305 are automatically converted to the selected connection type (star/delta). For bit 01: 87 Hz operation is only possible in the delta connection type. When selected, the maximum speed p1082 is automatically pre-assigned for a maximum output frequency of 87 Hz.			
<b>p0140</b>	<b>Number of Encoder Data Sets (EDS) / EDS count</b>

<b>Description:</b>	Sets the number of Encoder Data Sets (EDS).			
<b>Note:</b>	When parameterizing the drive with "no encoder" there must be at least one encoder data set (p0140 >= 1).			
<b>p0142[0...n]</b>	<b>Encoder component number / Encoder comp_no</b>			
	<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> Unsigned8

	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 4704	
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
	0	199	0	
<b>Description:</b>	This parameter is used to assign the encoder data set to an encoder. This assignment is made using the unique component number that was assigned when parameterizing the topology. Only component numbers can be entered into this parameter that correspond to an encoder.			
<b>Note:</b>	If the encoder evaluation and encoder are integrated (motor with DRIVE-CLiQ), then their component numbers are identical. For an SMC, different component numbers are assigned for the SMC (p0141) and the (actual) encoder (p0142).

	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 8570
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	99	0
<b>Description:</b>	Assign a drive data set (= index) the corresponding encoder data set (EDS) for encoder 1. The value corresponds to the number of the assigned encoder data set. Example: Encoder 1 in drive data set 2 should be assigned encoder data set 0. --> p0187[2] = 0		
<b>Note:</b>	A value of 99 means that no encoder has been assigned to this drive data set (not configured).		
<b>p0188[0...n]</b>	<b>Encoder 2 encoder data set number / Enc 2 EDS number</b>		
	<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> Unsigned8
	<b>Can be changed:</b> C(4)	<b>Scaling:</b> -	<b>Dyn. index:</b> DDS, p0180
	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 8570
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	99	1
<b>Description:</b>	Assign a drive data set (= index) the corresponding encoder data set (EDS) for encoder 2.		

## 2 Parameters

### 2.2 List of parameters

The value corresponds to the number of the assigned encoder data set.

Example:

Encoder 2 in drive data set 2 should be assigned to encoder data set 1.

--> p0188[2] = 1

**Note:** A value of 99 means that no encoder has been assigned to this drive data set (not configured).

	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	65535	0
<b>Description:</b>	Sets the actual code number from r0200 to acknowledge the power unit being used. When commissioned for the first time, the code number is automatically transferred from r0200 into p0201.		

**Note:** The parameter is used to identify when the drive is being commissioned for the first time.  
The power unit commissioning can only be exited (p0201 = r0200), if the actual and acknowledged code numbers are identical (p0010 = 2).  
When the code number is changed, the connection voltage (p0210) is checked and, if necessary, adjusted.

<b>Description:</b>	The duty cycles can be overloaded provided that the drive converter is operated with its base load current before and after the overload. This is based on a load duty cycle of 300 s.			
<b>Value:</b>	0: Load duty cycle with high overload for vector drives 1: Load duty cycle with low overload for vector drives			
<b>Dependency:</b>	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1), "Dynamic Drive Control" (DDC, p0096 = 2) Refer to: r3996			
<b>Notice:</b>	The parameter value is not reset when the factory setting is restored (see p0010 = 30, p0970). When the power unit use is changed, short-term communication interruptions may occur.			
<b>Note:</b>	When the parameter is changed, all of the motor parameters (p0305 ... p0311), the technological application (p0500) and the control mode (p1300) are pre-assigned according to the selected application. The parameter has no influence when calculating the thermal overload. p0205 can only be changed to the settings that are saved in the power unit EEPROM.

## 2 Parameters

### 2.2 List of parameters

**Notice:** If, in the switched-off state (pulse inhibit), the supply voltage is higher than the entered value, the Vdc controller may be automatically de-activated in some cases to prevent the motor from accelerating the next time the system is switched on. In this case, an appropriate alarm A07401 is output.

**Note:** Setting ranges for p0210 as a function of the rated power unit voltage:

U<sub>rated</sub> = 230 V:

- p0210 = 200 ... 240 V

U<sub>rated</sub> = 400 V:

- p0210 = 380 ... 480 V

U<sub>rated</sub> = 690 V:

- p0210 = 660 ... 690 V

**Dependency:**

Refer to: p1127, p1240, p1280, p1531

**Note:**

When setting a value for the braking power, the following calculations are made:

- p1240, p1280: Vdc<sub>max</sub> control is de-activated.

- p1531 = - p0219: the power limit when generating is set (limited to - p1530).

- the minimum ramp-down time is calculated (p1127) as a function of p0341, p0342 and p1082 (not for vector control with speed encoder).

If the parameter is reset again to zero, then the Vdc<sub>max</sub> controller is reactivated and the power limit as well as the ramp-down time are recalculated.

**Value:**

0: No filter

1: Motor reactor

2: dv/dt filter

3: Sine-wave filter Siemens

4: Sine-wave filter third-party

**Dependency:**

The following parameters are influenced using p0230:

p0230 = 1:

--> p0233 (power unit, motor reactor) = filter inductance

p0230 = 3:

--> p0233 (power unit, motor reactor) = filter inductance

--> p0234 (power unit sine-wave filter capacitance) = filter capacitance

--> p0290 (power unit overload response) = inhibit pulse frequency reduction

--> p1082 (maximum speed) = F<sub>max</sub> filter / pole pair number

--> p1800 (pulse frequency) >= nominal pulse frequency of the filter

--> p1802 (modulator modes) = space vector modulation without overcontrol

p0230 = 4:

--> p0290 (power unit overload response) = inhibit pulse frequency reduction

--> p1802 (modulator modes) = space vector modulation without overcontrol

The user must set the following parameters according to the data sheet of the sine-wave filter and also the user must check whether they are permitted.

--> p0233 (power unit, motor reactor) = filter inductance

--> p0234 (power unit sine-wave filter capacitance) = filter capacitance

--> p1082 (maximum speed) = Fmax filter / pole pair number

--> p1800 (pulse frequency) >= nominal pulse frequency of the filter

Refer to: p0233, p0234, p0290, p1082, p1800, p1802

**Note:** The parameter cannot be changed if the power unit (e.g. PM260) is equipped with an internal sine-wave filter. For sine-wave filters, the test pulse evaluation to detect short-circuits is always de-activated. If a filter type cannot be selected, then this filter type is not permitted for the power unit.

p0230 = 1:

Power units with output reactor are limited to output frequencies of 150 Hz.

p0230 = 3:

Power units with sine-wave filter are limited to output frequencies of 200 Hz.

**Description:** Enter the inductance of a filter connected at the power unit output.

**Dependency:** This parameter is automatically pre-set when you select a filter via p0230 if a SIEMENS filter is defined for the power unit.

Refer to: p0230

**Note:** When exiting the quick commissioning using p3900 = 1, the parameter value is set to the value of the defined SIEMENS filter or to zero. For this reason, the parameter value of a third-party filter only has to be entered outside the commissioning phase (p0010 = 0) and then the controller calculation (p0340 = 3) is carried out. The parameter cannot be changed if the power unit has an internal sine-wave filter.

Refer to: p0230

## 2 Parameters

### 2.2 List of parameters

**Note:** The parameter value includes the sum of all of the capacitances of a phase connected in series (phase - ground).  
When exiting the quick commissioning using p3900 = 1, the parameter value is set to the value of the defined SIEMENS filter or to zero. For this reason, the parameter value of a third-party filter only has to be entered outside the commissioning phase (p0010 = 0).  
The parameter cannot be changed if the power unit has an internal sine-wave filter.

<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 8021	
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
0	13	2	

**Description:** Sets the response to a thermal overload condition of the power unit.  
The following quantities can result in a response to thermal overload:  
- heat sink temperature (r0037[0]).  
- chip temperature (r0037[1]).  
- power unit overload I2t (r0036).  
Possible measures to avoid thermal overload:  
- reduce the output current limit r0289 and r0067 (for closed-loop speed or torque control) or the output frequency (for U/f control) indirectly via the output current limit and the intervention of the current limiting controller).  
- reduce the pulse frequency.  
A reduction, if parameterized, is always realized after an appropriate alarm is output.

<b>Value:</b>	0: Reduce output current or output frequency 1: No reduction shutdown when overload threshold is reached 2: Reduce I <sub>output</sub> or f <sub>output</sub> and f <sub>pulse</sub> (not using I <sub>2t</sub> ) 3: Reduce the pulse frequency (not using I <sub>2t</sub> ) 12: I <sub>output</sub> or f <sub>output</sub> and automatic pulse frequency reduction 13: Automatic pulse frequency reduction
<b>Dependency:</b>	If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), then only responses can be selected without pulse frequency reduction (p0290 = 0, 1). For a thermal power unit overload, an appropriate alarm or fault is output, and r2135.15 or r2135.13 set. Refer to: r0036, r0037, p0230, r2135 Refer to: A05000, A05001, A07805
<b>Notice:</b>	If the thermal overload of the power unit is not sufficiently reduced by the actions taken, the drive is always shut down. This means that the power unit is always protected irrespective of the setting of this parameter.
<b>Note:</b>	The setting p0290 = 0, 2 is only practical if the load decreases with decreasing speed (e.g. for applications with variable torque such as for pumps and fans). Under overload conditions, the current and torque limit are reduced, and therefore the motor is braked and forbidden speed ranges (e.g. minimum speed p1080 and suppression [skip] speeds p1091 ... p1094) can be passed through. For p0290 = 2, 3, 12, 13, the I <sub>2t</sub> overload detection of the power unit does not influence the response "Reduce pulse frequency". When the motor data identification routine is selected, p0290 cannot be changed. For short-circuit/ground fault detection, when the test pulse evaluation is active via p1901 "Test pulse evaluation configuration", the pulse frequency at the instant of switch on is briefly reduced.

**Dependency:** When selecting p0300 = 10 ... 19, parameters p0335, p0626, p0627, and p0628 of the thermal motor model are pre-assigned as a function of p0307 and p0311.

For p0096 = 1 (Standard Drive Control) synchronous motor types cannot be selected.

**Caution:**

If a motor is selected, which is not contained in the motor lists (p0300 < 100), then the motor code number must be reset (p0301 = 0), if previously a motor was parameterized from the motor list.

**Notice:**

If a catalog motor is selected (p0300 >= 100) and an associated motor code number (p0301), then the parameters that are associated with this list cannot be changed (write protection). The write protection is canceled if the motor type p0300 is set to a non-Siemens motor that matches p0301 (e.g. p0300 = 1 for p0301 = 1xxxx). Write protection is automatically canceled when the results of motor data identification are copied to the motor parameters.

The motor type of a catalog motor corresponds to the upper three digits of the code number or the following assignment (if the particular motor type is listed):

**Note:**

Motor without DRIVE-CLiQ: Once the Control Unit has been switched on for the first time or if the factory settings have been defined accordingly, the motor type is pre-configured as induction motor (p0300 = 1).

With p0300 = 10000, for a motor with DRIVE-CLiQ, the motor parameters are automatically downloaded, with p0300 = 10001, the motor parameters of a second data set (if available).

If a motor type has not been selected (p0300 = 0), then the drive commissioning routine cannot be exited.

A motor type with a value above p0300 >= 100 describes motors for which a motor parameter list exists.

Motor types with a value below p0300 < 100 correspond to the selection of a third-party motor. When appropriately selected, this means that the motor parameters are pre-assigned the settings for a third-party motor.

This also applies for parameters for a motor with DRIVE-CLiQ. In this case p0300 can only be set to p0300 = 10000 or 10001 (read motor parameters) or to the corresponding non-Siemens motor (first digit of the motor code number) in order to be able to cancel the write protection.

**Description:**

Selects the motor type or starts to read in the motor parameters for a motor with DRIVE-CLiQ (p0300 = 10000 or 10001, if there is a second data set).

For  $p0300 < 10000$  the following applies:

The first digit of the parameter value always defines the general motor type and corresponds to the third-party motor belonging to a motor list:

1 = induction motor

2 = synchronous motor

xx = motor without code number

xxx = motor with code number

The type information must be entered to filter motor-specific parameters and to optimize the operating characteristics and behavior. For example, for synchronous motors, power factor ( $p0308$ ) is neither used nor displayed (in the BOP/AOP).

The following applies for values  $< 100$ :

Motor data must be manually entered.

The following applies for values  $\geq 100$ :

Motor data are automatically loaded from an internal list.

**Value:**

0: No motor  
1: Induction motor  
2: Synchronous motor  
10: 1LE1 induction motor (not a code number)  
13: 1LG6 induction motor (not a code number)  
17: 1LA7 induction motor (not a code number)  
19: 1LA9 induction motor (not a code number)  
100: 1LE1 induction motor  
101: 1PC1 induction motor  
104: 1PH4 induction motor  
107: 1PH7 induction motor  
108: 1PH8 induction motor  
271: 1FG1 synchronous geared motor without encoder  
277: 1FK7 synchronous motor without encoder  
10000: Motor with DRIVE-CLiQ  
10001: Motor with DRIVE-CLiQ 2nd data set

**Dependency:**

When selecting  $p0300 = 10 \dots 19$ , parameters  $p0335$ ,  $p0626$ ,  $p0627$ , and  $p0628$  of the thermal motor model are pre-assigned as a function of  $p0307$  and  $p0311$ .

**Caution:**

If a motor is selected, which is not contained in the motor lists ( $p0300 < 100$ ), then the motor code number must be reset ( $p0301 = 0$ ), if previously a motor was parameterized from the motor list.

**Notice:**

If a catalog motor is selected ( $p0300 \geq 100$ ) and an associated motor code number ( $p0301$ ), then the parameters that are associated with this list cannot be changed (write protection). The write protection is canceled if the motor type  $p0300$  is set to a non-Siemens motor that matches  $p0301$  (e.g.  $p0300 = 1$  for  $p0301 = 1xxxx$ ). Write protection is automatically canceled when the results of motor data identification are copied to the motor parameters.

The motor type of a catalog motor corresponds to the upper three digits of the code number or the following assignment (if the particular motor type is listed):

Type/code number ranges

100 / 100xx, 110xx, 120xx, 130xx, 140xx, 150xx

104 / 104xx, 114xx, 124xx

107 / 107xx, 117xx, 127xx,

108 / 108xx, 118xx, 128xx, 138xx, 148xx, 158xx

271 / 271xx, 281xx

277 / 277xx, 287xx, 297xx

**Note:**

Motor without DRIVE-CLiQ: Once the Control Unit has been switched on for the first time or if the factory settings have been defined accordingly, the motor type is pre-configured as induction motor ( $p0300 = 1$ ).

With  $p0300 = 10000$ , for a motor with DRIVE-CLiQ, the motor parameters are automatically downloaded, with  $p0300 = 10001$ , the motor parameters of a second data set (if available).

If a motor type has not been selected ( $p0300 = 0$ ), then the drive commissioning routine cannot be exited.

A motor type with a value above  $p0300 \geq 100$  describes motors for which a motor parameter list exists.

Motor types with a value below  $p0300 < 100$  correspond to the selection of a third-party motor. When appropriately selected, this means that the motor parameters are pre-assigned the settings for a third-party motor.

This also applies for parameters for a motor with DRIVE-CLiQ. In this case  $p0300$  can only be set to  $p0300 = 10000$  or  $10001$  (read motor parameters) or to the corresponding non-Siemens motor (first digit of the motor code number) in order to be able to cancel the write protection.

	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	1	50	1

**Description:** Sets the number (count) of motors that can be operated in parallel using one motor data set. Depending on the motor number entered, internally an equivalent motor is calculated. The following should be observed in motors connected in parallel:  
Rating plate data should only be entered for one motor: p0305, p0307  
The following parameters are also only valid for one motor: p0320, p0341, p0344, p0350 ... p0361  
All other motor parameters take into account the replacement/equivalent motor (e.g. r0331, r0333).

**Recommendation:** For motors connected in parallel, external thermal protection should be provided for each individual motor.

**Dependency:** Refer to: r0331, r0370, r0373, r0374, r0376, r0377, r0382

**Caution:**  The motors to be connected in parallel must be of the same type and size (same order no. (MLFB)). The mounting regulations when connecting motors in parallel must be carefully maintained!  
The number of motors set must correspond to the number of motors that are actually connected in parallel. After changing p0306, it is imperative that the control parameters are adapted (e.g. using automatic calculation with p0340 = 1, p3900 > 0).  
For induction motors that are connected in parallel, but which are not mechanically coupled with one another, then the following applies:  
- an individual motor must not be loaded beyond its stall point.

**Notice:** If p0306 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is appropriately pre-assigned.

**Note:** Only operation with U/f characteristic makes sense if more than 10 identical motors are connected in parallel.

---

<b>Dependency:</b>	This parameter is only available for p0100 = 0, 2. Refer to: p0100, p0309, r0332
<b>Notice:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.
<b>Note:</b>	The parameter is not used for synchronous motors (p0300 = 2xx). Once the Control Unit has booted for the first time or if the factory settings have been restored, the parameter is pre-assigned to match the power unit.

For p0320 = 0.000 the magnetizing current is internally calculated and displayed in r0331.  
Synchronous motors:  
Sets the rated motor short-circuit current.

**Notice:**

When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected.  
Information in p0300 should be carefully observed when removing write protection.

**Note:**

The magnetizing current p0320 for induction motors is reset when quick commissioning is exited with p3900 > 0.  
If, for induction motors, the magnetizing current p0320 is changed outside the commissioning phase (p0010 > 0), then the magnetizing inductance p0360 is changed so that the EMF r0337 remains constant.

<b>Description:</b>	Sets the optimum load angle for synchronous motors with reluctance torque. The load angle is measured at the rated motor current.		

---

- Notice:** When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.
- Note:** This parameter has no significance for induction motors.  
For synchronous motors without reluctance torque, a angle of 90 degrees must be set.  
When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).

**Note:**

p0340 = 1 contains the calculations of p0340 = 2, 3, 4, 5.

p0340 = 2 calculates the motor parameters (p0350 ... p0360).

p0340 = 3 contains the calculations of p0340 = 4, 5.

p0340 = 4 only calculates the controller parameters.

p0340 = 5 only calculates the controller limits.

When quick commissioning is exited using p3900 > 0, p0340 is automatically set to 1.

At the end of the calculations, p0340 is automatically set to 0.

#### p0341[0...n]

**Description:**

Sets the motor moment of inertia (without load).

**Dependency:**

IEC drives (p0100 = 0): unit kg m<sup>2</sup>

NEMA drives (p0100 = 1): unit lb ft<sup>2</sup>

The parameter value is included, together with p0342, in the rated starting time of the motor.

Refer to: p0342, r0345

**Notice:**

When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected.

Information in p0300 should be carefully observed when removing write protection.

**Note:**

The product of p0341 \* p0342 is used when the speed controller (p0340 = 4) is calculated automatically.

	0.000 [s]	20.000 [s]	0.000 [s]
<b>Description:</b>	Sets the excitation build-up time of the motor. This involves the delay time between enabling the pulses and enabling the ramp-function generator. The induction motor is magnetized during this time.		
<b>Caution:</b>	If there is insufficient magnetization under load or if the acceleration rate is too high, then an induction motor can stall (refer to the note).		
			
<b>Note:</b>	The parameter is calculated using p0340 = 1, 3. For induction motors, the result depends on the rotor time constant (r0384). If this time is excessively reduced, this can result in an inadequate magnetizing of the induction motor. This is the case if the current limit is reached while building up magnetizing. For induction motors, the parameter cannot be set to 0 s (internal limit: 0.1 * r0384). For permanent-magnet synchronous motors and vector control, the value depends on the stator time constant (r0386). Here, it defines the time to establish the current for encoderless operation immediately after the pulses have been enabled.		
<b>p0347[0...n]</b>	<b>Motor de-excitation time / Mot t_de-excitat</b>

<b>Description:</b>	Sets the de-magnetizing time (for induction motors) after the inverter pulses have been canceled. The inverter pulses cannot be switched in (enabled) within this delay time.		

## 2 Parameters

### 2.2 List of parameters

**Note:** The parameter is calculated using  $p0340 = 1, 3$ .  
For induction motors, the result depends on the rotor time constant ( $r0384$ ).  
if this time is shortened too much, then this can result in an inadequate de-magnetizing of the induction motor and in an overcurrent condition when the pulses are subsequently enabled (only when the flying restart function is activated and the motor is rotating).

<b>p0350[0...n]</b>	<b>Motor stator resistance cold / Mot R_stator cold</b>		
<b>Access level:</b> 3	<b>Calculated:</b> $p0340 = 1,2$	<b>Data type:</b> FloatingPoint32	
<b>Can be changed:</b> C(3), U, T	<b>Scaling:</b> -	<b>Dyn. index:</b> MDS

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
0.00000 [ohm]	2000.00000 [ohm]	0.00000 [ohm]	

**Description:** Sets the stator resistance of the motor at ambient temperature  $p0625$  (phase value).  
**Dependency:** Refer to:  $p0625, r1912$   
**Notice:** When selecting a catalog motor ( $p0301$ ), this parameter is automatically pre-assigned and is write protected. Information in  $p0300$  should be carefully observed when removing write protection.  
**Note:** The motor identification routine determines the stator resistance from the total stator resistance minus the cable resistance ( $p0352$ ).

---

<b>p0352[0...n]</b>	<b>Cable resistance / R_cable</b>		
<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> FloatingPoint32	
<b>Can be changed:</b> C(3), U, T	<b>Scaling:</b> -	<b>Dyn. index:</b> MDS	
<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -	
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
0.00000 [ohm]	120.00000 [ohm]	0.00000 [ohm]	

**Description:** Resistance of the power cable between the power unit and motor.  
**Caution:**  The cable resistance should be entered prior to motor data identification. If it is used subsequently, the difference by which  $p0352$  was changed must be subtracted from the stator resistance  $p0350$  or motor data identification must be repeated.  
**Note:** The parameter influences the temperature adaptation of the stator resistance.  
The motor identification sets the cable resistance to 20% of the measured total resistance if  $p0352$  is zero at the time that the measurement is made. If  $p0352$  is not zero, then the value is subtracted from the measured total stator resistance to calculate stator resistance  $p0350$ . In this case,  $p0350$  is a minimum of 10% of the measured value.  
The cable resistance is reset when quick commissioning is exited with  $p3900 > 0$ .  
If the stator resistance is available in a motor list, and if  $p0352$  is still zero, then the cable resistance is generated from the difference between the measured value and list value.

<b>Description:</b>	Induction machine: sets the stator leakage inductance of the motor. Synchronous motor: Sets the stator quadrature axis inductance of the motor. This parameter value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor identification routine (p1910).		
<b>Notice:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Note:</b>	If the stator leakage inductance (p0356) for induction motors is changed outside the commissioning phase (p0010 > 0), the magnetizing inductance (p0360) is automatically adapted to the new EMF (r0337). You are then advised to repeat the measurement for the saturation characteristic (p1960). For permanent-magnet synchronous motors (p0300 = 2), this is the non-saturated value and is, therefore, ideal for a low current.

## 2 Parameters

### 2.2 List of parameters

**Notice:** When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:** The parameter is not used for synchronous motors (p0300 = 2).

	10.0 [%]	800.0 [%]	60.0 [%]
<b>Description:</b>	The saturation characteristics (flux as a function of the magnetizing current) is defined using 4 points. This parameter specifies the y coordinate (flux) for the 1st value pair of the characteristic. Sets the first flux value of the saturation characteristic as a [%] referred to the rated motor flux (100 %).		
<b>Dependency:</b>	The following applies for the flux values: p0362 < p0363 < p0364 < p0365 Refer to: p0366		
<b>Note:</b>	For induction motors, p0362 = 100 % corresponds to the rated motor flux. When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).

 10058: Digital encoder (absolute) identified  
 10059: Digital encoder (incremental) identified  
 10100: Identify encoder (waiting)

**Dependency:**

Refer to: p0468

**Notice:**

An encoder type with p0400 < 9999 defines an encoder for which there is an encoder parameter list. When selecting a catalog encoder (p0400 < 9999) the parameters from the encoder parameter list cannot be changed (write protection). To remove write protection, the encoder type should be set to a third-party encoder (p0400 = 9999).

If the encoder interface p0468[x] is reconfigured, the encoder configuration is reset p0400[x] = 0.

**Note:**

The connected encoder can be identified by setting p0400 to 10000 or 10100. This assumes that the encoder supports this method, which is possible in the following cases: Motor with DRIVE-CLiQ, encoder with EnDat interface, DRIVE-CLiQ encoder, encoder with SSI interface (only 10100)..

The encoder data (e.g. pulse number p0408) can only be changed when p0400 = 9999.

When using an encoder with track A/B and zero pulse, as standard, fine synchronization is not set using a zero mark. If, for a synchronous motor, fine synchronization is to be realized using a zero mark, then the following must be executed:

- set p0400 to 9999

- set p0404.15 to 1

Prerequisite:

Coarse synchronization must be selected (e.g. pole position identification) and the zero pulse of the encoder must be either mechanically or electronically (p0431) adjusted to the pole position.

For p0400 = 10000 the following applies:

If an identification is not possible, then p0400 is set to 0.

For p0400 = 10100 the following applies:

If an identification is not possible, p0400 remains set to 10100 until it becomes possible.

**Note:** For p0402 = 1:  
 Automatic setting of p0410 = 0000 bin, p0432 = 1, p0433 = 1.  
 For p0402 = 2:  
 Automatic setting of p0410 = 0011 bin, p0432 = 7, p0433 = 2.  
 For p0402 = 3:  
 Automatic setting of p0410 = 0011 bin, p0432 = 17, p0433 = 4.  
 For p0402 = 4:  
 Automatic setting of p0410 = 0011 bin, p0432 = 10, p0433 = 2.  
 For p0402 = 9999:  
 No automatic setting of p0410, p0432, p0433. The parameters should be manually set.  
 For p0402 = 10000:  
 It is only possible to identify the gearbox type for a motor with DRIVE-CLiQ. Parameters p0410, p0432 and p0433 are set corresponding to the identified gearbox. If an identification is not possible, then p0402 is set to 9999.

**Note:** ZM: Zero mark  
 SMC: Sensor Module Cabinet  
 If a technique to determine the commutation information/data has not been selected (e.g. track C/D, Hall sensor), and the encoder pulse number is an integer multiple of the pole number, then the following applies:  
 The track A/B is adjusted to match the magnetic position of the motor.  
 For bit 01, 02 (absolute encoder, multiturn encoder):  
 These bits can only be selected for EnDat encoders, SSI encoders or DRIVE-CLiQ encoders.

## 2 Parameters

### 2.2 List of parameters

For bit 10 (DRIVE-CLiQ encoder):

This bit is only used for the large-scale integrated DRIVE-CLiQ encoders that provide their encoder data directly in DRIVE-CLiQ format without converting this data. This bit is not, therefore, set for first-generation DRIVE-CLiQ encoders.

For bit 12 (equidistant zero mark):

The zero marks occur at regular intervals (e.g. rotary encoder with 1 zero mark per revolution or linear encoder with constant zero mark distance).

The bit activates monitoring of the zero mark distance (p0424/p0425, linear/rotary) or in the case of the linear encoder with 1 zero mark and p0424 = 0 zero mark monitoring is activated.

For bit 13 (irregular zero mark):

The zero marks occur at irregular intervals (e.g. a linear scale with only 1 zero mark in the traversing range). The zero mark distance is not monitored.

For bit 14 (distance-coded zero mark):

The distance (clearance) between two or several consecutive zero marks allows the absolute position to be calculated.

For bit 15 (commutation with zero mark):

Only applicable for synchronous motors.

The function can be de-selected by priority via p0430.23.

For distance-coded zero marks, the following applies:

The phase sequence of the C/D track (if available) must be the same as the phase sequence of the encoder (A/B track).

The phase sequence of the Hall signal (if available) must be the same as the phase sequence of the motor. Further, the position of the Hall sensor must be mechanically adjusted to the motor EMF.

The fine synchronization is only started after two zero marks have been passed.

When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

**Note:**

For bit 02:

When the function is activated, track monitoring can be de-activated by setting p0437.26.

For bit 05:

When the function is activated, a frequency setpoint and a direction for traveling can be entered via an encoder interface.

**Notice:** For p0411.3 = 1 the following applies:  
If position tracking is activated for incremental encoders, only the position actual value is stored. Axis or encoder motion is not detected when de-activated! Any tolerance window entered in p0413 has no effect.

**Note:** For the following events, the non-volatile, saved position values are automatically reset:  
- when an encoder replacement has been identified.  
- when changing the configuration of the Encoder Data Set (EDS).

<b>p0412[0...n]</b>	<b>Measuring gear absolute encoder rotary revolutions virtual / Abs rot rev</b>

	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 4704
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	4194303	0
<b>Description:</b>	Sets the number of rotations that can be resolved for a rotary encoder with activated position tracking of the measuring gear.		
<b>Dependency:</b>	This parameter is only of significance for an absolute encoder (p0404.1 = 1) with activated position tracking (p0411.0 = 1) and for an incremental encoder with activated position tracking (p0411.3 = 1).		
<b>Note:</b>	The resolution that is set must be able to be represented using r0483. For rotary axes/modulo axes, the following applies: p0411.0 = 1: This parameter is pre-set with p0421 and can be changed. p0411.3 = 1: The parameter value is pre-set to the highest possible value. The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419). For linear axes, the following applies: p0411.0 = 1: This parameter is pre-assigned with p0421, expanded by 6 bits for multiturn information (maximum number of overflows) and cannot be changed. p0411.3 = 1: The parameter value is pre-set to the highest possible value. The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).		

<b>p0413[0...n]</b>	<b>Measuring gear position tracking tolerance window / Pos track window</b>

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00	4294967300.00	0.00
<b>Description:</b>	Sets a tolerance window for position tracking. After the system is switched on, the difference between the saved position and the actual position is determined, and depending on this, the following is initiated: Difference within the tolerance window --> The position is reproduced as a result of the encoder actual value. Difference outside the tolerance window --> An appropriate message is output.		
<b>Dependency:</b>	Refer to: F31501, F32501		
<b>Caution:</b>	Rotation, e.g. through a complete encoder range is not detected.		
			
<b>Note:</b>	The value is entered in integer (complete) encoder pulses. For p0411.0 = 1, the value is automatically pre-assigned quarter of the encoder range. Example: Quarter of the encoder range = (p0408 * p0421) / 4 It is possible that the tolerance window may not be able to be precisely set due to the data type (floating point number with 23 bit mantissa).		

<b>p0418[0...n]</b>	<b>Fine resolution Gx_XIST1 (in bits) / Enc fine Gx_XIST1</b>		
	<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> Unsigned8
	<b>Can be changed:</b> C(4)	<b>Scaling:</b> -	<b>Dyn. index:</b> EDS, p0140
	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 4010, 4704
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	2	18	11
<b>Description:</b>	Sets the fine resolution in bits of the incremental position actual values.		

**Note:** The parameter applies for the following process data:

- Gx\_XIST1
- Gx\_XIST2 for reference mark or flying measurement

The fine resolution specifies the fraction between encoder pulses. Depending on the physical measurement principle, an encoder pulse can be broken down into a different number of fractions (e.g. squarewave encoder: 2 bit = resolution 4, sin/cos encoder: Typical 11 bit = resolution 2048).

For a squarewave encoder, with the factory setting, the least significant bits have the value zero, i.e. they do not supply any useful information.

For especially high quality measuring systems, the fine resolution must be increased corresponding to the available accuracy.

30	Amplitude correction	Yes	No	-
31	Offset correction	Yes	No	-

**Notice:** A bit-wise configuration is only possible if the corresponding property is also present in r0458.

**Note:** For bit 17 (burst oversampling):

- if bit = 1, burst oversampling is switched on.

For bit 18 (continuous oversampling):

- if bit = 1, continuous oversampling is switched on.

For bit 19 (Safety position actual value sensing):

- if bit = 1, the Safety position actual value is transferred in the cyclic telegram.

For bit 20 (speed calculation mode):

- if bit = 1, the speed is calculated via incremental difference without extrapolation.

- if bit = 0, the speed is calculated via edge time measurement with extrapolation. p0453 is effective in this mode.

For bit 21 (zero mark tolerance):

- if bit = 1, a one-off zero mark distance error is tolerated. In the event of a defect, the fault F3x100/F3x101 does not appear, but alarm A3x400/A3x401 does.

For bit 22 (rotor position adaptation):

- if bit = 1, the rotor position is corrected automatically. The correction speed is +/-1/4 encoder pulse per zero mark distance.

For bit 23 (de-select commutation with zero mark):

- the bit should only be set for encoders that have not been adjusted.

For bit 24 (commutation with selected zero mark):

- if bit = 1, the commutation position is corrected via a selected zero mark.

For bit 25 (disconnect the encoder power supply on parking):

- if bit = 1, the encoder power supply is switched off on parking (0 V).

- if bit = 0, the encoder power supply is not switched off on parking, it is reduced from 24 V to 5 V.

For bit 27 (extrapolate position values):

- if bit = 1, the extrapolation of the position values is activated.

For bit 28 (cubic correction):

- if bit = 1, the cubic correction for track A/B sine is activated.

For bit 29 (phase correction):

- if bit = 1, the phase correction for track A/B sine is activated.

For bit 30 (amplitude correction):

- if bit = 1, the amplitude correction for track A/B sine is activated.

For bit 31 (offset correction):

- if bit = 1, the offset correction for track A/B sine is activated.

**Factory setting**

-180.00 [°]

180.00 [°]

0.00 [°]

**Description:** Sets the angular commutation offset.

**Dependency:** The value is taken into account in r0094.

Refer to: r0094, r1778

- Notice:** When the firmware is upgraded from V2.3 to V2.4 or higher, the value must be reduced by 60° if all the following conditions are fulfilled:
- the motor is a synchronous motor (p0300 = 2, 2xx, 4, 4xx).
  - the encoder is a resolver (p0404.23 = 1).
  - the actual speed value is inverted (p0410.0 = 1).
- The angular commutation offset cannot be generally taken from other drive systems. As a minimum - the sign of the offset determined for SIMODRIVE 611 digital and SIMODRIVE 611 universal must be reversed for SINAMICS (p0431 (SINAMICS) = -p1016 (SIMODRIVE)).
- Note:** Angular commutation offset, angular difference between electrical position of encoder and flux position.
- For p0404.5 = 1 (track C/D) the following applies:  
The angular offset in p0431 acts on track A/B, the zero mark on track C/D.
- For p0404.6 = 1 (Hall sensor) the following applies:  
The angular offset in p0431 acts on track A/B and the zero mark.

28	EnDat linear encoder monitoring incremental/absolute	Yes	No	-
29	EnDat encoder initialization with high accuracy	Yes	No	-
31	Analog unipolar track monitoring	Yes	No	-

**Dependency:**

Refer to: p0430, r0459

**Note:**

A value of zero is displayed if an encoder is not present.

For bit 00:

When the data logger (trace) is activated, in the case of a fault, data before and after the event are recorded (traced) and saved in files on the non-volatile memory medium. Experts can then evaluate this data.

For bit 01:

If bit = 0, the zero mark is evaluated by ANDing tracks A and B and the zero mark.

For bit = 1, the zero mark is evaluated depending on the direction of rotation detected. For a positive direction of rotation, the positive edge of the zero mark is considered and for a negative direction of rotation, the negative edge of the zero mark.

For bit 02:

If the bit is set, in the event of a deviation less than the tolerance window for the zero mark (p4681, p4682), the pulses per revolution are corrected. If the bit is not set, encoder fault F3x131 is triggered.

For bits 05, 04:

The actual hardware only supports 1x or 4x signal evaluation.

Bit 5/4 = 0/0: Signal evaluation per period, 4x.

Bit 5/4 = 1/0: Illegal setting.

Bit 5/4 = 0/1: Signal evaluation per period, 1x.

Bit 5/4 = 1/1: Illegal setting.

For bit 06:

If the function is active, when dn/dt monitoring responds, the speed actual value is internally frozen for a time equivalent to two current controller clock cycles. The rotor position continues to be integrated. The actual value is then re-enabled after this time has expired.

For bit 07:

If the bit is set, the encoder pulses which have not been corrected are added to p4688 at the zero mark.

For bit 11:

If the bit is set, the Sensor Module checks within a certain time grid whether the fault cause is still present. This enables the Sensor Module to switch from the fault state to the operating state and provide valid actual values automatically. The faults are displayed until the user acknowledges them.

For bit 12:

Additional fault messages can be activated for extended fault diagnostics.

For bit 13:

When the bit is set, for an incremental encoder with zero mark, the absolute value in Gn\_XIST2 can be requested via Gn\_STW.13. The absolute value is only valid after passing the zero mark.

For bit 26:

Track monitoring is de-activated for the square-wave encoders when the bit is set, even if the monitoring function is selected in p0405.2.

For bit 28:

Monitoring of the difference between incremental and absolute position in the case of linear encoders.

For bit 29:

When the bit is set, the EnDat encoder is initialized under a certain speed and, therefore, with high accuracy. If initialization at a higher speed is requested, fault F31151, F32151, or F33151 is output.

## 2 Parameters

### 2.2 List of parameters

For bit 31:

When monitoring is active, the levels of the individual track signals and the corresponding inverted track signals are monitored separately.

<b>p0438[0...n]</b>	<b>Squarewave encoder filter time / Enc t_filt</b>		
	<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> FloatingPoint32
	<b>Can be changed:</b> C(4)	<b>Scaling:</b> -	<b>Dyn. index:</b> EDS, p0140
	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00 [µs]	100.00 [µs]	0.64 [µs]
<b>Description:</b>	Sets the filter time for a squarewave encoder. The hardware of the squarewave encoder only supports the following values: 0: No filtering 0.04 µs 0.64 µs 2.56 µs 10.24 µs 20.48 µs		
<b>Dependency:</b>	Refer to: r0452		
<b>Notice:</b>	If the filter time is too long, the track signals A/B/R may be suppressed and the appropriate messages output.		
<b>Note:</b>	The most suitable filter time depends on the number of pulses and maximum speed of the square-wave encoder. The filter time is automatically corrected to the next value when entering a non-specified value. In this case, no message is output. The effective filter time is displayed in r0452.

	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	1	0
<b>Description:</b>	Copies the actual serial number of the encoder belonging to this Encoder Data Set (EDS) to p0441 ... p0445. Example: For p0440[0] = 1, the serial number of the encoder belonging EDS0 is copied to p0441[0] ... p0445[0].		
<b>Value:</b>	0: No action 1: Transfer serial number		
<b>Dependency:</b>	Refer to: p0441, p0442, p0443, p0444, p0445, r0460, r0461, r0462, r0463, r0464		
<b>Note:</b>	For encoders with serial number, encoder replacement is monitored in order to request angular commutation calibration (adjustment) for motor encoders and absolute calibration for direct measuring systems with absolute value data. The serial number, which from then onwards is used for monitoring purposes, can be transferred using p0440.		

In the following cases, copying is automatically started in the following cases:

- 1.) When commissioning 1FT6, 1FK6, 1FK7 motors.
- 2.) When writing into p0431.
- 3.) For p1990 = 1.

p0440 is automatically set to 0 when the copying has been completed.

In order to permanently accept the copied values, it is necessary to save in a non-volatile fashion (p0977).

For bit 12:

The extended functions can be configured using p0437.

For bit 13:

Encoder faults can be acknowledged via Gn\_STW.15.

For bit 14:

Only for internal Siemens use.

For bit 23:

When the property is set, commutation with zero mark can be de-selected using p0430.23.

For bit 24:

If the property is set, commutation to the selected zero mark can be carried out.

For bit 14, 15:  
r0481.14 = 1 and r0481.15 = 0 can have one of the following causes:

- the encoder is parked.
- the encoder is de-activated.
- the encoder is being commissioned.
- no parameterized encoder available.
- encoder data set is being changed over.

r0481.14 = 1 and r0481.15 = 1 has the following significance:  
An encoder error has occurred and the encoder position actual value (Gn\_XIST1) is invalid.

**Note:**

- this value is reset if necessary when the "parking encoder" (r0481.14) function is de-selected.
- in this value, the measuring gear (p0432, p0433) is only taken into account when the position tracking is activated (p0411.0 = 1).
- the update time for the position control (EPOS) corresponds to the position controller clock cycle.
- the update time in isochronous operation corresponds to the bus cycle time r2064[1].
- the update time in isochronous operation and with position control (EPOS) corresponds to the position controller clock cycle.
- the update time in non-isochronous operation or without position control (EPOS) comprises the following:  
Update time = 4 \* least common multiple (LCM) of all current controller clock cycles in the drive group (infeed + drives).

The minimum update time is 1 ms.

**r0483[0...2] CO: Encoder actual position value Gn\_XIST2 / Enc Gn\_XIST2**

<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> Unsigned32
<b>Can be changed:</b> -	<b>Scaling:</b> -	<b>Dyn. index:</b> -
<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 4704, 4750
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
-	-	-

**Description:** Displays the encoder actual position value Gn\_XIST2 according to PROFIdrive.

**Recommendation:** Possible causes:  
For Error code = 4097, 4098: Defective Control Unit hardware.  
For Error codes = 4099, 4100: Too many measuring pulses have occurred.

**Index:** [0] = Encoder 1  
[1] = Encoder 2  
[2] = Reserved

**Notice:** The encoder position actual value must be requested using the encoder control word Gn\_STW.13.

**Note:**

- in this value, the measuring gear (p0432, p0433) is only taken into account when the position tracking is activated (p0411.0 = 1).
- if GxZSW.15 = 1 (r0481), then an error code with the following significance is located in Gx\_XIST2 (r0483):

- 1: Encoder fault.
- 2: Possible position shift in Gx\_XIST1.
- 3: Encoder parking not possible.

## 2 Parameters

### 2.2 List of parameters

- 4: Cancellation, reference block search (e.g. reference mark not available or input terminal for external zero mark not set). Zero mark is requested, however according to p0404.12/13/14 there is no zero mark (alarm A07565).  
 5: Cancellation, fetch reference value (e.g. illegal change from reference mark search to flying measurement).  
 6: Cancel flying measuring (e.g. input terminal for probe not set).  
 7: Cancellation, fetch measured value (e.g. illegal change from flying measurement to reference mark search).  
 8: Abort, absolute value transfer.  
 3841: Function not supported.  
 4097: Abort, reference mark search due to an initialization error.  
 4098: Abort, flying measurement due to an initialization error.  
 4099: Abort, reference mark search due to a measuring error.  
 4100: Abort, flying measurement due to a measuring error.

<b>p0491</b>	<b>Motor encoder fault response ENCODER / Fault resp ENCODER</b>		
	<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> Integer16
	<b>Can be changed:</b> T	<b>Scaling:</b> -	<b>Dyn. index:</b> -
	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	5	0
<b>Description:</b>	Sets the behavior for the ENCODER fault response (motor encoder). This means, for example, if an encoder fault occurs, encoderless operation can be automatically selected with a shutdown behavior that can be selected.		
<b>Value:</b>	0: Encoder fault results in OFF2 1: Enc fault results in encoderless oper. and oper. continues 2: Encoder fault results in encoderless operation and OFF1 3: Encoder fault results in encoderless operation and OFF3 4: Encoder fault results in DC braking 5: Enc fault results in encoderless op, operation continues, alarm		
<b>Dependency:</b>	The following parameters are relevant for encoderless operation.		
<b>Caution:</b>	For a value = 1, 2, 3, 5 the following applies: - encoderless operation must have been started. For a value = 1, the following applies: - in spite of the motor encoder fault that has occurred, the motor continues to operate.		
<b>Note:</b>	For a value = 1, 2, 3, 5 the following applies: - Refer to the status signal "encoderless operation due to a fault" (BO: r1407.13). - if, with r1407.13 = 1, a different drive data set is selected (e.g. interconnection from p0820), then the open-loop or closed-loop control type p1300 of this data set must match that of the original data set (e.g. p1300 = 21). Encoderless closed-loop controlled operation is kept when changing over. For a value = 4, the following applies: - the value can only be set for all data sets when p1231 = 4 - DC braking must be commissioned (p1232, p1233, p1234). For a value = 5, the following applies: Same function as for value = 1. However, faults are output as alarm and the message bit "Fault active" (r2139.3) is not set. The encoder fault has to be acknowledged via the encoder interface in order to resume operation with encoder.

**Note:** For a value of 0.0, the speed change monitoring is disabled.

<b>Description:</b>	Sets the input terminal for selecting the reference mark via BERO/switching signal when performing referencing with several zero marks. The encoder interface supplies the position of the reference mark, which was detected immediately after the positive edge of the BERO signal.		
<b>Value:</b>	0: No meas probe 24: DI/DO 24 (X208-3) 25: DI/DO 25 (X208-4) 26: DI/DO 26 (X208-5) 27: DI/DO 27 (X208-6)		
<b>Dependency:</b>	Refer to: p0490		
<b>Note:</b>	Refer to the encoder interface for PROFIdrive. The terminal must be set as input (p0728). For p0493 = 0 (factory setting) the following applies: - there is no logic operation between the reference mark search and an input signal. For p0493 > 0, the following applies: - the positive edge of the input signal is evaluated. If the negative edge is to be evaluated, signal inversion must be parameterized via p0490. - if a parameter change is rejected, a check should be performed as to whether the input terminal is already being used in p0580, p0680, p2517, or p2518.

This operating mode is possible for passive loads. These include applications where the load does not generate regenerative torque when breaking away and the motor comes to a standstill (zero speed) itself when the pulses are inhibited. For p1802 / p1803: p1802 and p1803 are only changed, in all cases, if a sine-wave output filter (p0230 = 3, 4) has not been selected.

## 2 Parameters

### 2.2 List of parameters

**Notice:** For p0530 = 101, 102, 103, 104, the maximum bearing speed (p0532) is write protected. Write protection is withdrawn with p0530 = 1.

If p0530 is changed during quick commissioning (p0010 = 1), then the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned appropriately. This is not the case when commissioning the motor (p0010 = 3). The maximum speed of the bearing is factored into the limit for the maximum speed p1082.

**Note:** For a motor with DRIVE-CLiQ, p0530 can only be set to 1.

**Description:** Sets the maximum speed of the bearing.  
The following applies when calculating the maximum speed (p1082):  
- for p0324 = 0 or p0532 = 0, p0322 is used.  
- for p0324 > 0 and p0532 > 0, the minimum value from the two parameters is used.

**Dependency:** Refer to: p0301, p0322, p0530, p1082

**Notice:** This parameter is pre-assigned in the case of motors from the motor list (p0301) if a bearing version (p0530) is selected.

When selecting a catalog motor, this parameter cannot be changed (write protection). The information in p0530 should be observed when removing write protection.

If p0532 is changed during quick commissioning (p0010 = 1), then the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned appropriately. This is not the case when commissioning the motor (p0010 = 3).

<b>Description:</b>	Sets the alarm threshold for monitoring the motor temperature for motor temperature model 2 or KTY/PT1000. After the alarm threshold is exceeded, alarm A07910 is output and timer (p0606) is started. If the delay time has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F07011 is output.		
<b>Dependency:</b>	Refer to: p0606, p0612 Refer to: F07011, A07910		
<b>Notice:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

<b>Description:</b>	Sets the threshold and temperature value to monitor the motor temperature. Temperature model 1 (I2t, p0612.0 = 1): The following applies for firmware version < 4.7 SP6 or p0612.8 = 0: - sets the alarm threshold. If the model temperature (r0034) exceeds the alarm threshold, then alarm A07012 is output. - this value is simultaneously used as rated winding temperature. The following applies from firmware version 4.7 SP6 and p0612.8 = 1: - p5390: when commissioning a catalog motor for the first time, p0605 is copied to p5390. - p5390: p5390 is of significance when evaluating the alarm threshold. - p5390: the stator winding temperature (r0632) is used to initiate the signal. - p0627: when a catalog motor is commissioned for the first time, p0605 -40 °C is copied to p0627. - p0627: p0627 is of significance for the rated temperature. Motor temperature model 2 (p0612.1 = 1) or measurement: - sets the fault threshold. If the temperature (r0035) exceeds the fault threshold, then fault F07011 is output.		
<b>Dependency:</b>	Refer to: r0034, p0606, p0611, p0612 Refer to: F07011, A07012		
<b>Notice:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection. Motor temperature model 1 (I2t): The following applies for firmware version < 4.7 SP6 or p0612.8 = 0: p0605 also defines the final temperature of the model for r0034 = 100 %. Therefore, p0605 has no influence on the time up to alarm A07012 being issued. The time is only determined by time constant p0611, the actual current and the reference value p0318. For p0318 = 0, the rated motor current is used as reference value.		
<b>Note:</b>	The hysteresis is 2 K. When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0.000 [s]	600.000 [s]	0.000 [s]
<b>Description:</b>	Sets the timer for monitoring the motor temperature for motor temperature model 2 or KTY/PT1000. This timer is started when the temperature alarm threshold (p0604) is exceeded. If the timer has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F07011 is output. If the temperature fault threshold (p0605) is prematurely exceeded before the timer has expired, then fault F07011 is immediately output.	
<b>Dependency:</b>	Refer to: p0604, p0605 Refer to: F07011, A07910	
<b>Note:</b>	With p0606 = 0 s, the timer is de-activated and only the fault threshold is effective. KTY/PT1000: When setting the minimum value, the timer is disabled and a fault is not output until p0605 is exceeded. PTC, bimetallic NC contact: The timer minimum value has no special significance.

<b>Can be changed:</b> C(3), U, T	<b>Scaling:</b> -	<b>Dyn. index:</b> MDS
<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 8016
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0.000 [s]	600.000 [s]	0.100 [s]
<b>Description:</b>	Sets the timer between the output of alarm and fault for a temperature sensor fault. If there is a sensor fault, this timer is started. If the sensor fault is still present after the timer has expired, a corresponding fault is output.	
<b>Notice:</b>	The parameterized time is internally rounded-off to an integer multiple of 48 ms.	
<b>Note:</b>	If the motor is an induction motor, the timer is switched off when setting the minimum value and no alarm is output. Temperature monitoring is then based on the thermal model.

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0	12	12
<b>Description:</b>	Sets the system response when the motor temperature reaches the alarm threshold.	
<b>Value:</b>	0: No response only alarm no reduction of I_max 1: Messages, reduction of I_max 2: Messages, no reduction of I_max 12: Messages, no reduction of I_max, temperature storage	
<b>Dependency:</b>	Refer to: p0601, p0604, p0605, p0614, p0615 Refer to: F07011, A07012, A07910	
<b>Note:</b>	The I_max reduction is not executed for PTC (p0601 = 1) or bimetallic NC contact (p0601 = 4). The I_max reduction results in a lower output frequency. If value = 0: An alarm is output and I_max is not reduced. If value = 1: An alarm is output and a timer is started. A fault is output if the alarm is still active after this timer has expired. - for KTY/PT1000, the following applies: I_max. is reduced - for PTC, the following is valid: I_max. is not reduced	

If value = 2:

An alarm is output and a timer is started. A fault is output if the alarm is still active after this timer has expired.

If value = 12:

Behavior is always the same as for value 2.

For motor temperature monitoring without temperature sensor, when switching off, the model temperature is saved in a non-volatile fashion. When switching on, the same value (reduced by p0614) is taken into account in the model calculation. As a consequence, the UL508C specification is fulfilled.

p0611[0...n]	I2t motor model thermal time constant / I2t mot_mod T		
	<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> FloatingPoint32
	<b>Can be changed:</b> C(1, 3), U, T	<b>Scaling:</b> -	<b>Dyn. index:</b> MDS

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0 [s]	20000 [s]	0 [s]
<b>Description:</b>	Sets the winding time constant. The time constant specifies the warm-up time of the cold stator winding when loaded with the motor standstill current (rated motor current, if the motor standstill current is not parameterized) up until a temperature rise of 63 % of the continuously permissible winding temperature has been reached.		
<b>Dependency:</b>	The parameter is only used for synchronous motors (p0300 = 2xx, 4) and synchronous reluctance motors (p0300 = 6xx). Refer to: r0034, p0612, p0615 Refer to: F07011, A07012, A07910		
<b>Notice:</b>	This parameter is automatically pre-set from the motor database for motors from the motor list (p0301). When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection. When exiting commissioning, p0612 is checked, and where relevant, is pre-assigned to a value that matches the motor power, if a temperature sensor was not parameterized (see p0601).		
<b>Note:</b>	When parameter p0611 is reset to 0, then this switches out the thermal I2t motor model (refer to p0612). If no temperature sensor is parameterized, then the ambient temperature for the thermal motor model is referred to p0625.

<b>Dependency:</b>	For synchronous motors and synchronous reluctance motors, when exiting commissioning, temperature model 1 is automatically activated if a time constant has been entered in p0611. Refer to: r0034, p0604, p0605, p0606, p0611, p0613, p0615, p0625, p0626, p0627, p0628, r0630, r0631, r0632, r0633, p5350, r5389, p5390, p5391 Refer to: F07011, A07012, A07014, A07910				
<b>Notice:</b>	For bit 00: This bit is only automatically activated for permanent-magnet 1FT7 synchronous motors and synchronous reluctance motors. For other permanent-magnet synchronous motors, the user himself must activate motor temperature model 1 (I2t). It is only possible to activate this motor temperature model (I2t) for a time constant greater than zero (p0611 > 0).				

## 2 Parameters

### 2.2 List of parameters

**Note:** Mot\_temp\_mod: motor temperature model

For bit 00:  
This bit is used to activate/de-activate the motor temperature model for permanent-magnet synchronous motors and synchronous reluctance motors.

For bit 01 (see also bit 9):  
This bit is used to activate/de-activate the motor temperature model for induction motors.

For bit 02:  
This bit is used to activate/de-activate the motor temperature model for 1FK7 Basic and 1FL5 motors.  
Motor temperature model 3 cannot be simultaneously activated with another motor temperature model.

For bit 08:  
This bit is used to extend the motor temperature model 1 (I2t).  
The following applies for firmware version < 4.7 SP6 (only bit 0):  
- this bit has no function. Temperature model 1 operates in the standard mode.  
Overtemperature at rated load: p0605 - 40 °C  
Alarm threshold: p0605  
Fault threshold: p0615  
The following applies from firmware version 4.7 SP6 (bits 0 and 8):  
- temperature model 1 operates in the extended mode.  
Overtemperature at rated load: p0627  
Alarm threshold: p5390  
Fault threshold: p5391

For bit 09:  
This bit is used to extend the motor temperature model 2.  
For firmware version < 4.7 following applies (only bit 1):  
- this bit has no function. Temperature model 2 operates in the standard mode.  
From firmware version 4.7 the following applies (bits 1 and 9):  
- this bit should be set. Temperature model 2 then operates in the extended mode and the result of the model is more precise.

For bit 12 (only effective if a temperature sensor has not been parameterized):  
This bit is used to set the ambient temperature for the motor temperature model 1 (I2t).  
The following applies for firmware version < 4.7 SP6 (only bit 0):  
- this bit has no function. Temperature model 1 operates with an ambient temperature of 20 °C.  
The following applies from firmware version 4.7 SP6 (bits 0 and 12):  
- the ambient temperature can be adapted to the conditions using p0613.

<b>Description:</b>	<p>Selects the identification of the stator resistance after booting the Control Unit (only for vector control). The result is used to initialize the thermal motor model.</p> <p>p0621 = 1: Identification of the stator resistance only when the drive is switched on for the first time (pulse enable) after booting the Control Unit.</p> <p>p0621 = 2: Identification of the stator resistance every time the drive is switched on (pulse enable).</p>

<b>Dependency:</b>	<p>- perform motor data identification (see p1910) with cold motor. - enter ambient temperature at time of motor data identification in p0625. Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1) Refer to: p0622, r0623</p>		
<b>Notice:</b>	<p>The calculated stator temperature can only be compared with the measured value of a temperature sensor (KTY/PT1000) to a certain extent, as the sensor is usually the warmest point of the stator winding, whereas the measured value of identification reflects the mean value of the stator winding. Furthermore this is a short-time measurement with limited accuracy that is performed during the magnetizing phase of the induction motor.</p>		
<b>Note:</b>	<p>The measurement is carried out:</p> <ul style="list-style-type: none"> <li>- For induction motors</li> <li>- When vector control is active (see p1300)</li> <li>- if a temperature sensor (KTY/PT1000) has not been connected</li> <li>- When the motor is at a standstill when switched on</li> </ul> <p>When a flying restart is performed on a rotating motor, the temperatures of the thermal motor model are set to a third of the overtemperatures. This occurs only once, however, when the CU is booted (e.g. after a power failure). If identification is activated, the magnetizing time is determined via p0622 and not via p0346. Quick magnetizing (p1401.6) is de-energized internally and alarm A07416 is displayed. The speed is enabled after completion of the measurement.</p>

The speed is enabled after measurement is complete, but not before the time in p0346 has elapsed (see r0056 bit 4). The time taken for measurement also depends on the settling time of the measured current.</p> <p>For p0622 &gt;= p0346 the following applies: Parameter p0622 is internally limited to the magnetizing time p0346, so that p0346 represents the maximum possible magnetizing time during identification. **Description:** Sets the response threshold for the wire breakage monitoring of the analog inputs.  
The unit for the parameter value depends on the set analog input type.

**Index:**  
[0] = AI0 (T. 3/4)  
[1] = AI1 (T. 10/11)

**Dependency:** For the following analog input type, the wire breakage monitoring is active:  
p0756[0...1] = 1 (unipolar voltage input monitored (+2 V ... +10 V)), unit [V]  
p0756[0...1] = 3 (unipolar current input monitored (+4 mA ... +20 mA)), unit [mA]  
Refer to: p0756

**Note:** AI: Analog Input  
When p0761 = 0, wire breakage monitoring is not carried out.

**Description:** Determines the width of the dead zone at the analog input.  
Analog input type unipolar (e.g. 0 ... +10 V):  
The dead zone starts with the characteristic value x1/y1 (p0757/p0758).  
Analog input type bipolar (e.g. -10 V ... +10 V):  
The dead zone is located at the symmetrical center between characteristic value x1/y1 (p0757/p0758) and x2/y2 (p0759/p0760). The set value doubles the dead zone.

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	1100	0

**Description:** Sets the transfer direction and start of data transfer between the memory card and non-volatile device memory.

Example 1:

The parameter backup is to be transferred from the non-volatile device memory to the memory card with setting 0.

The parameter backup is to be stored on the memory card with setting 22.

p0802 = 22 (parameter backup stored on memory card as target with setting 22)

p0803 = 0 (parameter backup stored in device memory as source with setting 0)

p0804 = 2 (start data transfer from device memory to memory card)

--> PS000xxx.ACX is transferred from device memory to memory card and stored as PS022xxx.ACX.

--> the parameter backup PS022xxx.ACX on the memory card can be used for data backup.

Example 2:

The parameter backup is to be transferred from the memory card to the non-volatile device memory with setting 22.

The parameter backup is to be stored in the device memory as setting 10.

p0802 = 22 (parameter backup stored on memory card as source with setting 22)

p0803 = 10 (define parameter backup with setting 10 as target in the device memory)

p0804 = 1 (start data transfer from memory card to device memory)

--> PS022xxx.ACX is transferred from memory card to device memory and stored as PS010xxx.ACX.

--> this parameter backup can be loaded to the volatile device memory using p0010 = 30 and p0970 = 10.

--> to permanently save in the device memory and also on the memory card, this parameter backup should be saved using p0971 = 1.

Example 3 (only supported for PROFIBUS/PROFINET):

The PROFIBUS or PROFINET device master data (GSD) should be transferred from the device memory to the memory card.

p0802 = (not relevant)

p0803 = (not relevant)

p0804 = 12 (start transferring the GSD files to the memory card)

--> The GSD files are transferred from the device memory to the memory card and stored in the /SIEMENS/SINAMICS/DATA/CFG directory.

**Value:**  
 0: Inactive  
 1: Memory card to device memory  
 2: Device memory to memory card  
 12: Device memory (GSD files) to memory card  
 1001: File on memory card cannot be opened  
 1002: File in device memory cannot be opened  
 1003: Memory card not found  
 1100: File cannot be transferred

**Recommendation:** When switching off/switching on, a possibly valid parameter backup is loaded to the memory card with setting 0. Therefore, we do not recommend parameter backup with setting 0 (p0803 = 0) in the non-volatile device memory.

**Dependency:** Refer to: p0802, p0803

## 2 Parameters

### 2.2 List of parameters

**Notice:** The memory card must not be removed while data is being transferred.  
For p0014 = 1, the following applies:  
After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** If a parameter backup with setting 0 is detected on the memory card when the Control Unit is switched on (PS000xxx.ACX), this is transferred automatically to the device memory.  
When the memory card is inserted, a parameter backup with setting 0 (PS000xxx.ACX) is automatically written to the memory card when the parameters are saved in a non-volatile memory (e.g. by means of "Copy RAM to ROM").  
Once the data has been successfully transferred, this parameter is automatically reset to 0. If an error occurs, the parameter is set to a value > 1000. Possible fault causes:  
p0804 = 1001:  
The parameter backup set in p0802 as the source on the memory card does not exist or there is not sufficient memory space available on the memory card.  
p0804 = 1002:  
The parameter backup set in p0803 as the source in the device memory does not exist or there is not sufficient memory space available in the device memory.  
p0804 = 1003:  
No memory card has been inserted.

**Note:** If the motor numbers are identical, the same thermal motor model is used for calculation after data set changeover. If different motor numbers are used, different models are also used for calculating (the inactive motor cools down in each case).  
For the same motor number, the correction values of the Rs, Lh or kT adaptation are applied for the data set changeover (refer to r1782, r1787, r1797).

**Description:** Sets the signal source for the command "ON/OFF (OFF1)".

For the PROFIdrive profile, this command corresponds to control word 1 bit 0 (STW1.0).

**Recommendation:** When the setting for this binector input is changed, the motor can only be switched on by means of an appropriate signal change of the source.

**Dependency:** Refer to: p1055, p1056

**Caution:** When "master control from PC" is activated, this binector input is ineffective.

**Notice:** For binector input p0840 = 0 signal, the motor can be moved, jogging using binector input p1055 or p1056.  
The command "ON/OFF (OFF1)" can be issued using binector input p0840 or p1055/p1056.

For binector input p0840 = 0 signal, the switching-on inhibited is acknowledged.

Only the signal source that originally switched on can also switch off again.

The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** For drives with closed-loop speed control (p1300 = 20, 21), the following applies:

- BI: p0840 = 0 signal: OFF1 (braking with the ramp-function generator, then pulse suppression)

For drives with closed-loop torque control (p1300 = 22, 23), the following applies:

- BI: p0840 = 0 signal: immediate pulse suppression

For drives with closed-loop torque control (activated using p1501), the following applies:

- BI: p0840 = 0 signal: No dedicated braking response, but pulse cancelation when standstill is detected (p1226, p1227)

For drives with closed-loop speed/torque control, the following applies:

- BI: p0840 = 0/1 signal: ON (pulses can be enabled)

For active infeeds (Active Line Module and Smart Line Module) the following applies:

- BI: p0840 = 0 signal: OFF1 (reduce Vdc along the ramp, then pulse suppression and precharging contactor/line contactor open)

- BI: p0840 = 0/1 signal: ON (precharging contactor/line contactor close, pulses can be enabled)

### 2.2 List of parameters

For the PROFIdrive profile, this command corresponds to control word 1 bit 10 (STW1.10).

BI: p0854 = 0 signal

No control by PLC

BI: p0854 = 1 signal

Master control by PLC.

**Caution:**

When "master control from PC" is activated, this binector input is ineffective.

**Notice:**

The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:**

This bit is used to initiate a response for the drives when the control fails (F07220). If there is no control available, then binector input p0854 should be set to 1.

If a control is available, then STW1.10 must be set to 1 (PZD1) so that the received data is updated. This applies regardless of the setting in p0854 and even in the case of free telegram configuration (p0922 = 999).

**Description:** Sets the monitoring time for the power unit.  
The monitoring time is started after an 0/1 edge of the ON/OFF1 command. If the power unit does not return a READY signal within the monitoring time, fault F07802 is output.

**Dependency:** Refer to: F07802, F30027

**Notice:** The maximum time to precharge the DC link is monitored in the power unit and cannot be changed. The maximum precharging duration depends on the power unit.

The monitoring time for the precharging is started after the ON command (BI: p0840 = 0/1 signal). Fault F30027 is output when the maximum precharging duration is exceeded.

**Note:** The factory setting for p0857 depends on the power unit.

The monitoring time for the ready signal of the power unit includes the time to precharge the DC link and, if relevant, the de-bounce time of the contactors.

If an excessively low value is entered into p0857, then after enable, this results in the corresponding fault.

### p0858[0...n] BI: Unconditionally close holding brake / Uncond close brake

<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> U32 / Binary
<b>Can be changed:</b> T	<b>Scaling:</b> -	<b>Dyn. index:</b> CDS, p0170
<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 2501, 2701
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
-	-	0

**Description:** Sets the signal source for the command "unconditionally close holding brake".

**Dependency:** Refer to: p0855

**Note:** The signal via BI: p0858 (unconditionally close holding brake) has a higher priority than via BI: p0855 (unconditionally open holding brake).

For a 1 signal via BI: p0858, the command "unconditionally close the holding brake" is executed and internally a zero setpoint is entered.

### p0860 BI: Line contactor feedback signal / Line contact feedb

<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> U32 / Binary
<b>Can be changed:</b> T	<b>Scaling:</b> -	<b>Dyn. index:</b> -
<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 2634
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
-	-	863.1

**Description:** Sets the signal source for the feedback signal from the line contactor.

**Recommendation:** When the monitoring is activated (BI: p0860 not equal to r0863.1), then to control the line contactor, signal BO: r0863.1 of its own drive object should be used.

**Dependency:** Refer to: p0861, r0863  
Refer to: F07300

**Notice:** The line contactor monitoring is de-activated if the control signal of the particular drive object is set as the signal source for the feedback signal of the line contactor (BI: p0860 = r0863.1).

**Note:** The state of the line contactor is monitored depending on signal BO: r0863.1.

When the monitoring is activated (BI: p0860 not equal to r0863.1), fault F07300 is then also output if the contactor is closed before it is controlled using r0863.1.

## 2 Parameters

	0 [ms]	5000 [ms]	100 [ms]
<b>Description:</b>	Sets the monitoring time of the line contactor. This time starts each time that the line contactor switches (r0863.1). If a feedback signal is not received from the line contactor within the time, a message is output.		
<b>Dependency:</b>	Refer to: p0860, r0863 Refer to: F07300		
<b>Note:</b>	The monitoring function is disabled for the factory setting of p0860.

<b>Description:</b>	Sets the main contactor holding time after OFF1		
<b>Dependency:</b>	Refer to: p0869		
<b>Note:</b>	After withdrawing the OFF1 enable (source of p0840), the main contactor is opened after the main contactor holding time has elapsed. For p0869 = 1 (keep main contactor closed for STO), after withdrawing STO, the switching-on inhibited must be acknowledged via the source of p0840 = 0 (OFF1) – and before the main contactor holding time expires, should go back to 1, otherwise the main contactor will open. When operating a drive connected to SINUMERIK, which only closes the main contactor with the OFF1 command (blocksize, chassis), p0867 should be set as a minimum to 50 ms.

**Note:** For bits 00, 01, 02, 04, 05, 06, 09:  
For PROFIdrive, these signals are used for status word 1.  
For bit 13:  
When the "Safe Brake Control" (SBC) is activated and selected, the brake is no longer controlled using this signal.  
For bit 14, 15:  
These signals are only of significance when the "extended brake control" function module is activated (r0108.14 = 1).

**Description:** Displays or sets the PROFIBUS address for PROFIBUS interface on the Control Unit.

The address can be set as follows:

1) Using the DIP switch on the Control Unit.

--> p0918 can then only be read and displays the selected address.

--> A change only becomes effective after a POWER ON.

2) Using p0918

--> Only if all of the DIP switches are set to ON or OFF.

--> The address is saved in a non-volatile fashion using the function "copy from RAM to ROM".

--> A change only becomes effective after a POWER ON.

**Notice:** For p0014 = 1, the following applies:  
After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

For p0014 = 0, the following applies:

Before a changed setting becomes permanently effective, a non-volatile RAM to ROM data save is required. To do this, set p0971 = 1 or p0014 = 1.

**Note:** Permissible PROFIBUS addresses: 1 ... 126  
Address 126 is used for commissioning.  
Every PROFIBUS address change only becomes effective after a POWER ON.

**Dependency:**

Refer to: F01505

**Note:**

For p0922 = 100 ... 199, p2038 is automatically set to 1 and p2038 can no longer be changed. This means that for these telegrams, the "SIMODRIVE 611 universal" interface mode is set and cannot be changed.

If a value is not equal to 999, a telegram is set and the automatically set interconnections in the telegram are inhibited.

The inhibited interconnections can only be changed again after setting value 999.

<b>Description:</b>	<p>The parameter is used to initiate the reset of the drive parameters. Parameters p0100, p0205 are not reset. The following motor parameters are defined in accordance with the power unit: p0300 ... p0311. When downloading settings 10, 11, 12, the buffer memory mode is automatically de-activated (p0014 = 0).</p>		
<b>Value:</b>	<p>0: Inactive 1: Start a parameter reset 3: Start download of volatile parameters from RAM 5: Starts a safety parameter reset 10: Start loading the parameters saved with p0971=10 11: Start loading the parameters saved with p0971=11 12: Start loading the parameters saved with p0971=12 30: Start loading the delivery state saved with p0971=30 100: Start a BICO interconnection reset 300: Only Siemens int</p>		
<b>Dependency:</b>	Refer to: F01659		
<b>Notice:</b>	<p>After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0. When the buffer memory is active (see p0014), the actual parameters are backed up from RAM to ROM when a parameter set is loaded (p0970 = 10, 11, 12). Peculiarities of communication via PROFIBUS DP: - Communication with Class 1 masters (e.g. S7 controllers) is interrupted. - Communication with Class 2 masters (e.g. STARTER) is retained.</p>		
<b>Note:</b>	<p>A factory setting run can only be started if p0010 was first set to 30 (parameter reset). At the end of the calculations, p0970 is automatically set to 0. Parameter reset is completed with p0970 = 0 and r3996[0] = 0. For p0970 = 5 the following applies: The password for Safety Integrated must be set. When Safety Integrated is enabled, this can result in messages, which then require an acceptance test to be performed. Then save the parameters and carry out a POWER ON. For p0970 = 1 the following applies: If a Safety Integrated function is parameterized (p9601), then the safety parameters are not reset. In this case, a fault (F01659) is output with fault value 2. The following generally applies: One index of parameters p2100, p2101, p2118, p2119, p2126, p2127 is not reset, if a parameterized message is precisely active in this index.</p>

## 2 Parameters

### 2.2 List of parameters

- 12: Save in non-volatile memory as setting 12  
30: State when delivered, save in non-volatile memory as setting 30

**Dependency:**

Refer to: p0970, p1960, p3845, r3996

**Caution:**

If a memory card (optional) is inserted – and the USB interface is not used, the following applies:  
The parameters are also saved on the card and therefore overwrite any existing data!

**Notice:**

The Control Unit power supply may only be switched off after data has been saved (i.e. after data save has been started, wait until the parameter again has the value 0).

Writing to parameters is inhibited while saving.

The progress while saving is displayed in r3996.

For p0971 = 30:

The original state when delivered is overwritten when executing this memory function.

**Note:**

Parameters saved with p0971 = 10, 11, 12 can be loaded again with p0970 = 10, 11 or 12.

Identification and maintenance data (I&M data, p8806 and following) are only saved for p0971 = 1.

**Description:**

Sets the required procedure to execute a hardware reset for the drive unit.

**Value:**

- 0: Inactive  
1: Hardware-Reset immediate  
2: Hardware reset preparation  
3: Hardware reset after cyclic communication has failed

**Danger:**

It must be absolutely ensured that the system is in a safe condition.  
The memory card/device memory of the Control Unit must not be accessed.

**Note:**

If value = 1:

Reset is immediately executed and communications interrupted.

After communications have been established, check the reset operation (refer below).

If value = 2:

Help to check the reset operation.

Firstly, set p0972 = 2 and then read back. Secondly, set p0972 = 1 (it is possible that this request is possibly no longer acknowledged). The communication is then interrupted.

After communications have been established, check the reset operation (refer below).

If value = 3:

The reset is executed after interrupting cyclic communication. This setting is used to implement a synchronized reset by a control for several drive units.

If cyclic communication is not active, then the reset is immediately executed.

After communications have been established, check the reset operation (refer below).

To check the reset operation:

After the drive unit has been restarted and communications have been established, read p0972 and check the following:

p0972 = 0? --> the reset was successfully executed.

p0972 = 0? --> the reset was not executed.

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Selects the required fixed speed setpoint using p1020 ... p1023.  
 Displays the number of the actual fixed speed setpoint in r1197.  
 Sets the values for the fixed speed setpoints 1 ... 15 using p1001 ... p1015.  
 Refer to: p1070, r1197

**Note:** If a fixed speed setpoint has not been selected (p1020 ... p1023 = 0, r1197 = 0), then r1024 = 0 (setpoint = 0).

<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> Unsigned16

<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 3020
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
-	-	0000 0110 bin

**Description:** Sets the configuration for the motorized potentiometer.

<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	00	Data save active	Yes	No	-
	01	Automatic mode ramp-function generator active	Yes	No	-
	02	Initial rounding-off active	Yes	No	-
	03	Save in NVRAM active	Yes	No	-
	04	Ramp-function generator always active	Yes	No	-

**Notice:** For p0014 = 1, the following applies:  
 After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** For bit 00:  
 0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p1040.  
 1: The setpoint for the motorized potentiometer is saved after OFF and after ON set to the saved value. In order to save in a non-volatile fashion, bit 03 should be set to 1.

For bit 01:  
 0: Without ramp-function generator in the automatic mode (ramp-up/ramp-down time = 0).  
 1: With ramp-function generator in the automatic mode.  
 For manual operation (0 signal via BI: p1041), the ramp-function generator is always active.

For bit 02:  
 0: Without initial rounding-off  
 1: With initial rounding-off. The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed).  
 The jerk for the initial rounding-off is independent of the ramp-up time and only depends on the selected maximum speed (p1082). It is calculated as follows:  

$$r = 0.01 \% * p1082 [1/s] / 0.13^2 [s^2]$$
  
 The jerk acts up until the maximum acceleration is reached ( $a_{max} = p1082 [1/s] / p1047 [s]$ ), and then the drive continues to run linearly with a constant rate of acceleration. The higher the maximum acceleration (the lower that p1047 is), the longer the ramp-up time increases with respect to the set ramp-up time.

For bit 03:

0: Non-volatile data save de-activated.

1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for bit 00 = 1).

For bit 04:

When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r1050.

**Description:** Sets the signal source to change over from manual to automatic when using a motorized potentiometer. In the manual mode, the setpoint is changed using two signals - raise and lower. In the automatic mode, the setpoint must be interconnected via a connector input.

**Dependency:** Refer to: p1030, p1035, p1036, p1042

**Note:** The effectiveness of the internal ramp-function generator can be set in automatic mode.

<b>Description:</b>	Sets the lowest possible motor speed. This value is not undershot in operation.		
<b>Dependency:</b>	Refer to: p1106		
<b>Notice:</b>	The effective minimum speed is formed from p1080 and p1106.

<b>Description:</b>	Sets the scaling for the maximum speed (p1082). For a higher-level speed control, this scaling allows the maximum speed to be briefly exceeded.		
<b>Dependency:</b>	Refer to: p1082		
<b>Notice:</b>	Continuous operation above a scaling of 100 % is not permitted.		
<b>p1082[0...n]</b>	<b>Maximum speed / n_max</b>

	<b>Can be changed:</b> C(1), T	<b>Scaling:</b> -	<b>Dyn. index:</b> DDS, p0180
	<b>Unit group:</b> 3_1	<b>Unit selection:</b> p0505	<b>Func. diagram:</b> 3020, 3050, 3060, 3070
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.000 [rpm]	210000.000 [rpm]	1500.000 [rpm]
<b>Description:</b>	Sets the highest possible speed. Example: Induction motor p0310 = 50 / 60 Hz without output filter and Blocksize power unit p1082 <= 60 x 240 Hz / r0313 (vector control) p1082 <= 60 x 550 Hz / r0313 (U/f control)		
<b>Dependency:</b>	For vector control, the maximum speed is restricted to 60.0 / (8.333 x 500 μs x r0313). This can be identified by a reduction in r1084. p1082 is not changed in this process due to the fact that the operating mode p1300 can be changed over.  If a sine-wave filter (p0230 = 3) is parameterized as output filter, then the maximum speed is limited corresponding to the maximum permissible filter output frequency (refer to the filter data sheet). When using sine-wave filters (p0230 = 3, 4), the maximum speed r1084 is limited to 70% of the resonant frequency of the filter capacitance and the motor leakage inductance.  For reactors and dU/dt filters, it is limited to 120 Hz / r0313. Refer to: p0230, r0313, p0322		
<b>Notice:</b>	After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.		
<b>Note:</b>	The parameter applies for both motor directions.  The parameter has a limiting effect and is the reference quantity for all ramp-up and ramp-down times (e.g. down ramps, ramp-function generator, motor potentiometer).  The parameter is part of the quick commissioning (p0010 = 1); this means that it is appropriately pre-assigned when changing p0310, p0311, p0322.		

## 2 Parameters

### 2.2 List of parameters

The following limits are always effective for p1082:

$p1082 \leq 60 \times \text{minimum} (15 \times r0310, 550 \text{ Hz}) / r0313$

$p1082 \leq 60 \times \text{maximum power unit pulse frequency} / (k \times r0313)$ , with  $k = 12$  (vector control),  $k = 6.5$  (U/f control)

During automatic calculation ( $p0340 = 1$ ,  $p3900 > 0$ ), the parameter value is assigned the maximum motor speed ( $p0322$ ). For  $p0322 = 0$  the rated motor speed ( $p0311$ ) is used as default (pre-assignment) value. For induction motors, the synchronous no-load speed is used as the default value ( $p0310 \times 60 / r0313$ ).

For synchronous motors, the following additionally applies:

During automatic calculation ( $p0340$ ,  $p3900$ ),  $p1082$  is limited to speeds where the EMF does not exceed the DC link voltage.

$p1082$  is also available in the quick commissioning ( $p0010 = 1$ ); this means that when exiting via  $p3900 > 0$ , the value is not changed.

<b>Description:</b>	Sets the bandwidth for the skip speeds/velocities 1 to 4.			
<b>Dependency:</b>	Refer to: p1091, p1092, p1093, p1094			
<b>Note:</b>	The setpoint (reference) speeds are skipped (suppressed) in the range of the skip speed +/-p1101. Steady-state operation is not possible in the skipped (suppressed) speed range. The skip (suppression) range is skipped. Example: p1091 = 600 and p1101 = 20 --> setpoint speeds between 580 and 620 [rpm] are skipped. For the skip bandwidths, the following hysteresis behavior applies: For a setpoint speed coming from below, the following applies: r1170 < 580 [rpm] and 580 [rpm] <= r1114 <= 620 [rpm] --> r1119 = 580 [rpm] For a setpoint speed coming from above, the following applies: r1170 > 620 [rpm] and 580 [rpm] <= r1114 <= 620 [rpm] --> r1119 = 620 [rpm]

<b>Dependency:</b>	Refer to: p1082, p1123		
<b>Note:</b>	The ramp-up time can be scaled via connector input p1138. The parameter is adapted during the rotating measurement (p1960 > 0). This is the reason that during the rotating measurement, the motor can accelerate faster than was originally parameterized. For U/f control and sensorless vector control (see p1300), a ramp-up time of 0 s does not make sense. The setting should be based on the startup times (r0345) of the motor.

## 2 Parameters

### 2.2 List of parameters

The ramp-function generator ramps-down the speed setpoint from the maximum speed (p1082) down to standstill (setpoint = 0) in this time.

Further, the ramp-down time is always effective for OFF1.

**Dependency:**

Refer to: p1082, p1123

**Note:**

For U/f control and sensorless vector control (see p1300), a ramp-down time of 0 s does not make sense. The setting should be based on the startup times (r0345) of the motor.

#### BI: Bypass ramp-function generator / Bypass RFG

<b>Access level:</b> 4	<b>Calculated:</b> -	<b>Data type:</b> U32 / Binary
<b>Can be changed:</b> U, T	<b>Scaling:</b> -	<b>Dyn. index:</b> CDS, p0170
<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 2505
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
-	-	0

**Description:**

Sets the signal source for bypassing the ramp generator (ramp-up and ramp-down times = 0).

**Caution:**

If the technology controller is operated in mode p2251 = 0 (technology controller as main speed setpoint), then it is not permissible to disable the interconnection to its status word (r2349).

**Notice:**

The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:**

In the case of sensorless vector control, the ramp-function generator must not be bypassed, other than indirectly by means of interconnection with r2349.

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0.000 [s]	999999.000 [s]	0.000 [s]

**Description:**

Sets the minimum ramp-up time.

The ramp-up time (p1120) is limited internally to this minimum value.

**Dependency:**

Refer to: p1082

**Note:**

The setting should be based on the startup times (r0345) of the motor.

If the maximum speed p1082 changes, p1123 is re-calculated.

PM240

<b>Access level:</b> 3	<b>Calculated:</b> p0340 = 1	<b>Data type:</b> FloatingPoint32
<b>Can be changed:</b> U, T	<b>Scaling:</b> -	<b>Dyn. index:</b> DDS, p0180
<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0.000 [s]	999999.000 [s]	0.000 [s]

**Description:**

Sets the minimum ramp-down time.

The ramp-down time (p1121) is limited internally to this minimum value.

The parameter cannot be set shorter than the minimum ramp-up time (p1123).

**Dependency:**

Refer to: p1082

**Note:**

For U/f control and sensorless vector control (see p1300), a ramp-down time of 0 s does not make sense. The setting should be based on the startup times (r0345) of the motor.

If the maximum speed p1082 changes, p1127 is re-calculated.

If a braking resistor is connected to the DC link (p0219 > 0), then the minimum ramp-down time is automatically adapted using p1127.

<b>Description:</b>	Sets the minimum ramp-down time. The ramp-down time (p1121) is limited internally to this minimum value. The parameter cannot be set shorter than the minimum ramp-up time (p1123).		
<b>Dependency:</b>	Refer to: p1082		
<b>Note:</b>	For U/f control and sensorless vector control (see p1300), a ramp-down time of 0 s does not make sense. The setting should be based on the startup times (r0345) of the motor. If the maximum speed p1082 changes, p1127 is re-calculated.

<b>Description:</b>	Sets the smoothed response to the OFF1 command or the reduced setpoint for the extended ramp-function generator.		
<b>Value:</b>	0: Cont smoothing 1: Discont smoothing		
<b>Dependency:</b>	No effect up to initial rounding-off time (p1130) > 0 s.		
<b>Note:</b>	p1134 = 0 (continuous smoothing) If the setpoint is reduced while ramping-up, initially a final rounding-off is carried out and then the ramp-up completed. During the final rounding-off, the output of the ramp-function generator continues to go in the direction of the previous setpoint (overshoot). After the final rounding-off has been completed, the output goes toward the new setpoint. p1134 = 1 (discontinuous smoothing) If the setpoint is reduced while ramping-up, then the output goes immediately in the direction of the new setpoint. For the setpoint change there is no rounding-off.

**Note:**

0/1 signal:  
The ramp-function generator output is immediately (without delay) set to the setting value of the ramp-function generator.

1 signal:  
The setting value of the ramp-function generator is effective.

1/0 signal:  
The input value of the ramp-function generator is effective. The ramp-function generator output is adapted to the input value using the ramp-up time or the ramp-down time.

0 signal:

<b>p1145[0...n]</b>	<b>Ramp-function generator tracking intensity. / RFG track intens</b>		
<b>Access level:</b> 4	<b>Calculated:</b> -	<b>Data type:</b> FloatingPoint32	
<b>Can be changed:</b> U, T	<b>Scaling:</b> -	<b>Dyn. index:</b> DDS, p0180	
<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 3080	
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
0.0	50.0	0.0	

**Description:** Sets the ramp-function generator tracking.  
The output value of the ramp-function generator is tracked (corrected) corresponding to the maximum possible drive acceleration.  
The reference value is the deviation at the speed controller/velocity controller input that is necessary to ensure that the motor accelerates at the torque/force limit.

**Recommendation:** If at least one speed setpoint filter/velocity setpoint filter is activated (p1414), then the ramp-function generator tracking should be de-activated (p1145 = 0.0). When the speed setpoint filter is activated, the output value of the ramp-function generator can no longer be tracked (corrected) corresponding to the maximum possible drive acceleration.  
For p1145 = 0.0:  
This value de-activates the ramp-function generator tracking.  
For p1145 = 0.0 ... 1.0:  
Generally, these values are not practical. They cause the motor to accelerate below its torque limit. The lower the selected value, the greater the margin between the controller and torque limit when accelerating.  
For p1145 > 1.0:  
The greater the value, the higher the permissible deviation between the speed setpoint and speed actual value.

**Notice:** If ramp-function generator tracking is activated and the ramp time is set too short, this can cause unsteady acceleration.  
Remedy:  
- de-activate ramp-function generator tracking (p1145 = 0).  
- increase the ramp-up/ramp-down time (p1120, p1121).

**Note:** In the U/f mode, ramp-function generator tracking is not active.  
The speed difference is reduced if the integral component of the speed controller is not maintained when the torque limit is reached (p1400.16 = 1).

<b>Description:</b>	Sets the operating mode for flying restart. The flying restart allows the drive converter to be switched on while the motor is still rotating. In so doing, the drive converter output frequency is changed until the actual motor speed/velocity is found. The motor then accelerates up to the setpoint at the ramp-function generator setting.				
<b>Value:</b>	0: Flying restart inactive 1: Flying restart always active (start in setpoint direction) 4: Flying restart always active (start only in setpoint direction)				

## 2 Parameters

### 2.2 List of parameters

- Dependency:** A differentiation is made between flying restart for U/f control and for vector control (p1300).  
 Flying restart, U/f control: p1202, p1203, r1204  
 Flying restart, vector control: p1202, p1203, r1205  
 For synchronous motors, flying restart cannot be activated.  
 Refer to: p1201  
 Refer to: F07330, F07331
- Notice:** The "flying restart" function must be used in cases where the motor may still be running (e.g. after a brief line supply interruption) or is being driven by the load. The system might otherwise shut down as a result of overcurrent.
- Note:** For p1200 = 1, 4, the following applies:  
 Flying restart is active after faults, OFF1, OFF2, OFF3.  
 For p1200 = 1, the following applies:  
 The search is made in both directions.  
 For p1200 = 4, the following applies:  
 The search is only made in the setpoint direction.  
 For U/f control (p1300 < 20), the following applies:  
 The speed can only be sensed for values above approx. 5 % of the rated motor speed. For lower speeds, it is assumed that the motor is at a standstill.  
 If p1200 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1200 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300).

10 [%]	400 [%]	100 [%]	

- Description:** Sets the search current for the "flying restart" function.  
 The value is referred to the motor magnetizing current.
- Dependency:** Refer to: r0331
- Caution:** An unfavorable parameter value can result in the motor behaving in an uncontrollable fashion.
- 
- Note:** In U/f control mode, the parameter serves as a threshold value for establishing the current at the beginning of the flying restart function. When the threshold value is reached, the prevailing search current is set dependent upon the frequency on the basis of voltage inputs.  
 Reducing the search current can also improve flying restart performance (if the system moment of inertia is not very high, for example).  
 For a reluctance motor, the parameter is only changed after the motor data identification has been carried out.

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
10 [%]	4000 [%]	100 [%]	
<b>Description:</b>	Sets the factor for the search speed for flying restart. The value influences the rate at which the output frequency is changed during a flying restart . A higher value results in a longer search time.		
<b>Recommendation:</b>	For encoderless vector control and motor cables longer than 200 m, set the factor p1203 >= 300 %.		
<b>Caution:</b>	An unfavorable parameter value can result in the motor behaving in an uncontrollable fashion.		
	For vector control, a value that is too low or too high can cause flying restart to become unstable.		
<b>Note:</b>	The parameter factory setting is selected so that standard induction motors that are rotating can be found and restarted as quickly as possible (fast flying restart). With this pre-setting, if the motor is not found (e.g. for motors that are accelerated as a result of active loads or with U/f control and low speeds), we recommend that the search rate is reduced (by increasing p1203). For the flying restart of a reluctance motor, the minimum search velocity is limited (p1203 >= 50 %).

#### p1210 Automatic restart mode / AR mode

<b>Access level:</b> 2	<b>Calculated:</b> -	<b>Data type:</b> Integer16

<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0	26	0

**Description:** Sets the automatic restart mode (AR).  
The parameters must be saved in the non-volatile memory p0971 = 1 in order that the setting becomes effective.

**Value:**

- 0: Inhibit automatic restart
- 1: Acknowledge all faults without restarting
- 4: Restart after line supply failure w/o additional start attempts
- 6: Restart after fault with additional start attempts
- 14: Restart after line supply failure following man. acknowledgment
- 16: Restart after fault following manual acknowledgment
- 26: Acknowledging all faults and reclosing for an ON command

**Recommendation:** For brief line supply failures, the motor shaft may still be rotating when restarting. The "flying restart" function (p1200) might need to be activated to restart while the motor shaft is still rotating.

**Dependency:** The automatic restart requires an active ON command (e.g., via a digital input). If, for p1210 > 1, there is no active ON command, then the automatic restart is interrupted.  
When using an Operator Panel in the LOCAL mode, then there is no automatic start.  
For p1210 = 14, 16, a manual acknowledgment is required for an automatic restart.  
Refer to: p0840, p0857  
Refer to: F30003

**Danger:**

If the automatic restart is activated (p1210 > 1) if there is an ON command (refer to p0840), the drive is switched on as soon as any fault messages that are present can be acknowledged. This also occurs after the line supply returns or the Control Unit boots if the DC link voltage is present again. This automatic switching-on operation can only be interrupted by withdrawing the ON command.

**Notice:**

A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1). When faults are present, therefore, the parameter cannot be changed.  
For p1210 > 1, the motor is automatically started.

- Note:** For p1210 = 1:  
 Faults that are present are automatically acknowledged. If new faults occur after a successful fault acknowledgment, then these are also automatically acknowledged again. p1211 has no influence on the number of acknowledgment attempts.
- For p1210 = 4:  
 An automatic restart is only performed if fault F30003 has occurred on the power unit. If additional faults are present, then these faults are also acknowledged and when successful, starting continues. If, for external 24 V power supplies of the Control Unit, additional faults subsequently occur, these are no longer interpreted as line faults and are therefore also not acknowledged.
- For p1210 = 6:  
 An automatic restart is carried out if any fault has occurred.
- For p1210 = 14:  
 as for p1210 = 4. However, active faults must be manually acknowledged.
- For p1210 = 16:  
 as for p1210 = 6. However, active faults must be manually acknowledged.
- For p1210 = 26:  
 as for p1210 = 6. For this mode, the switch-on command can be entered with a delay. The restart is interrupted with either OFF2 or OFF3. Alarm A07321 is only displayed if the cause of the fault has been removed and the drive is restarted by setting the switch-on command.

<b>p1211</b>	<b>Automatic restart start attempts / AR start attempts</b>

<b>Description:</b>	Sets the start attempts of the automatic restart function for p1210 = 4, 6, 14, 16, 26.		
<b>Dependency:</b>	A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1). Refer to: p1210, r1214 Refer to: F07320		
<b>Notice:</b>	After fault F07320 occurs, the switch-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated. After a complete power failure (blackout) the start counter always starts with the counter value that applied before the power failure, and decrements this start attempt by 1. If a further attempt to acknowledge is started by the automatic restart function prior to power failure, e.g. when the CU remains active on power failure longer than the time p1212 / 2, the fault counter will already have been decremented once. In this case, the start counter is thus decreased by the value 2.		
<b>Note:</b>	A start attempt starts immediately when a fault occurs. The start attempt is considered to be completed if the motor was magnetized (r0056.4 = 1) and an additional delay time of 1 s has expired. As long as a fault is present, an acknowledge command is generated in the time intervals of p1212 / 2. When successfully acknowledged, the start counter is decremented. If, after this, a fault re-occurs before a restart has been completed, then acknowledgment starts again from the beginning. Fault F07320 is output if, after several faults occur, the number of parameterized start attempts has been reached. After a successful start attempt, i.e. a fault/error has no longer occurred up to the end of the magnetizing phase, the start counter is again reset to the parameter value after 1 s. If a fault re-occurs - the parameterized number of start attempts is again available. At least one start attempt is always carried out. After a line supply failure, acknowledgment is immediate and when the line supply returns, the system is switched on. If, between successfully acknowledging the line fault and the line supply returning, another fault occurs, then its acknowledgment also causes the start counter to be decremented. For p1210 = 26: The start counter is decremented if after a successful fault acknowledgment, the on command is present.

<b>Description:</b>	Sets the monitoring time of the automatic restart (AR).		
<b>Index:</b>	[0] = Restart [1] = Reset start counter		
<b>Dependency:</b>	Refer to: p1210, r1214		
<b>Notice:</b>	A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1). After fault F07320 occurs, the switch-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated.		
<b>Note:</b>	For index 0: The monitoring time starts when the faults are detected. If the automatic acknowledgments are not successful, the monitoring time runs again. If, after the monitoring time has expired, the drive has still not successfully started again (flying restart and magnetizing of the motor must have been completed: r0056.4 = 1), then fault F07320 is output. The monitoring is de-activated with p1213 = 0. If p1213 is set lower than the sum of p1212, the magnetizing time p0346 and the additional delay time due to the flying restart, then fault F07320 is generated at each restart. If, for p1210 = 1, the time in p1213 is set lower than in p1212, then fault F07320 is also generated at each restart. The monitoring time must be extended if the faults that occur cannot be immediately and successfully acknowledged (e.g. for faults that are permanently present). In the case of p1210 = 14, 16, the faults which are present must be acknowledged manually within the time in p1213[0]. Otherwise, fault F07320 is generated after the set time. For index 1: The start counter (refer to r1214) is only set back to the starting value p1211 if, after successful restart, the time in p1213[1] has expired. The delay time is not effective for fault acknowledgment without automatic restart (p1210 = 1). After a power failure (blackout) the delay time only starts after the line supply returns and the Control Unit boots. The start counter is set to p1211, if F07320 occurred, the switch-on command is withdrawn and the fault is acknowledged. The start counter is immediately updated if the starting value p1211 or the mode p1210 is changed. For p1210 = 26, the fault must have been successfully acknowledged and the switch-on command issued within the time in p1213[0]. Otherwise, fault F07320 is generated after the set time.

State in which the automatic restart function waits for faults (initial state).

For bit 02:

General display that a fault has been identified and that the restart or acknowledgment has been initiated.

For bit 03:

Displays the acknowledge command within the "acknowledge alarms" state (bit 4 = 1). For bit 5 = 1 or bit 6 = 1, the acknowledge command is continually displayed.

For bit 04:

State in which the faults that are present are acknowledged. The state is exited again after successful acknowledgment. A change is only made into the next state if it is signaled that a fault is no longer present after an acknowledgment command (bit 3 = 1).

For bit 05:

State in which the drive is automatically switched on (only for p1210 = 4, 6).

For bit 06:

State in which the system waits after having been switched on, to the end of the start attempt (to the end of the magnetizing process).

For p1210 = 1, this signal is directly set after the faults have been successfully acknowledged.

For bit 07:

State which is assumed after a fault occurs within the automatic restart function. This is only reset after acknowledging the fault and withdrawing the switch-on command.

For bit 10:

When the automatic restart function is active, r1214.7 is displayed, otherwise the active fault r2139.3.

For bits 12 ... 15:

Actual state of the start counter (binary coded).

For bit 04 in addition:

For p1210 = 26, the system waits in this state until the switch-on command is available.

<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 2701, 2707, 2711
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0	3	0

**Description:** Sets the holding brake configuration.

**Value:** 0: No motor holding brake available  
 1: Motor holding brake acc. to sequence control  
 2: Motor holding brake always open  
 3: Motor holding brake like sequence control connection via BICO

**Dependency:** Refer to: p1216, p1217, p1226, p1227, p1228, p1278

**Caution:** For the setting p1215 = 0, if a brake is used, it remains closed. If the motor moves, this will destroy the brake.

 **Notice:** If p1215 was set to 1 or if p1215 was set to 3, then when the pulses are suppressed, the brake is closed even if the motor is still rotating. Pulse suppression can either be caused by a 0 signal at p0844, p0845 or p0852 or as a result of a fault with OFF2 response. If this is not desirable (e.g. for a flying restart), then the brake can be kept open using a 1 signal at p0855.

**Note:** If the configuration is set to "no holding brake present" when booting, then the motor holding brake will be automatically identified. If a motor holding brake is detected, the configuration is set to "motor holding brake as for sequence control".  
 If a motor holding brake is used via the brake connection of the Power Module integrated in the drive, then it is not permissible that p1215 is set to 3.  
 If an external motor holding brake is being used, then p1215 should be set to 3 and r0899.12 should be interconnected as control signal.  
 The parameter can only be set to zero when the pulses are inhibited.  
 The parameterization "no motor holding brake available" and "Safe Brake Control" enabled (p1215 = 0, p9602 = 1, p9802 = 1) is not practical if there is no motor holding brake.  
 The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical.

**Description:** Sets the time to open the motor holding brake.  
 After the holding brake has been controlled (opened), the speed setpoint remains at zero for this time. After this, the speed setpoint is enabled.

**Recommendation:** This time should be set longer than the actual opening time of the brake. This ensures that the drive cannot accelerate when the brake is applied.

**Dependency:** Refer to: p1215, p1217

**Note:** For a motor with DRIVE-CLiQ and integrated brake, for p0300 = 10000, this time is pre-assigned the value saved in the motor.

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0 [ms]	10000 [ms]	100 [ms]

**Description:** Sets the time to apply the motor holding brake.  
 After OFF1 or OFF3 and the controlling (closing) of the holding brake, the drive remains stationary under closed-loop control for this time with a speed setpoint of zero. The pulses are suppressed when the time expires.

<b>Recommendation:</b>	This time should be set longer than the actual closing time of the brake. This ensures that the pulses are only suppressed after the brake has closed.
<b>Dependency:</b>	Refer to: p1215, p1216
<b>Notice:</b>	If the selected closing time is too short with respect to the actual closing time of the brake, then the load can sag. If the closing time is selected to be too long with respect to the actual closing time of the brake, the control works against the brake and therefore reduces its lifetime.
<b>Note:</b>	For a motor with DRIVE-CLiQ and integrated brake, for p0300 = 10000, this time is pre-assigned the value saved in the motor.

<b>Description:</b>	Sets the speed threshold for the standstill identification. Acts on the actual value and setpoint monitoring. When braking with OFF1 or OFF3, when the threshold is undershot, standstill is identified.		
<b>Dependency:</b>	Refer to: p1227		
<b>Caution:</b>	For closed-loop speed and torque control without encoder, the following applies: If p1226 is set to values under approx. 1 % of the rated motor speed, then the model switchover limits of the vector control must be increased in order to guarantee reliable shutdown (see p1755, p1750.7).		
			
<b>Note:</b>	Standstill is identified in the following cases: - the speed actual value falls below the speed threshold in p1226 and the time started after this in p1228 has expired. - the speed setpoint falls below the speed threshold in p1226 and the time started after this in p1227 has expired. The actual value sensing is subject to measuring noise. For this reason, standstill cannot be detected if the speed threshold is too low.

<b>Description:</b>	Sets the monitoring time for the standstill identification. When braking with OFF1 or OFF3, standstill is identified after this time has expired, after the setpoint speed has fallen below p1226 (also refer to p1145).		
<b>Dependency:</b>	The parameter is pre-assigned depending on the size of the power unit. Refer to: p1226		
<b>Notice:</b>	For p1145 > 0.0 (RFG tracking) the setpoint is not equal to zero dependent on the selected value. This can therefore cause the monitoring time in p1227 to be exceeded. In this case, for a driven motor, the pulses are not suppressed.		
<b>Note:</b>	Standstill is identified in the following cases: - the speed actual value falls below the speed threshold in p1226 and the time started after this in p1228 has expired. - the speed setpoint falls below the speed threshold in p1226 and the time started after this in p1227 has expired. For p1227 = 300.000 s the following applies: Monitoring is de-activated. For p1227 = 0.000 s, the following applies: With OFF1 or OFF3 and a ramp-down time = 0, the pulses are immediately suppressed and the motor "coasts" down. Once the Control Unit has been booted up for the first time or if the factory settings have been defined accordingly, the parameter is defined in accordance with the power unit.

<b>Description:</b>	Setting to activate DC braking.		
<b>Value:</b>	0: No function 4: DC braking 5: DC braking for OFF1/OFF3 14: DC braking below starting speed		
<b>Dependency:</b>	Refer to: p0300, p1232, p1233, p1234, r1239		
<b>Note:</b>	The function can only be used for induction motors (p0300 = 1). For p1231 = 4: The function is activated as soon as the activation criterion is fulfilled. - the function can be superseded by an OFF2 response. Activation criterion (one of the following criteria is fulfilled): - binector input p1230 = 1 signal (DC braking activation, depending on the operating mode). - the drive is not in the state "S4: Operation" or in "S5x". - the internal pulse enable is missing (r0046.19 = 0). DC braking can only be withdrawn (p1231 = 0) if it is not being used as a fault response in p2101. In order that DC braking is active as fault response, the corresponding fault number must be entered in p2100 and fault response p2101 set = 6.		

For p1231 = 5:

DC braking is activated if the OFF1 or OFF3 command is present. Binector input p1230 is ineffective. If the drive speed still lies above the speed threshold p1234, then initially, the drive is ramped-down to this threshold, demagnetized (see p0347) and is then switched into DC braking for the time set in p1233. After this, the drive is switched-off. If, at OFF1, the drive speed is below p1234, then it is immediately demagnetized and switched into DC braking. A change is made into normal operation if the OFF1 command is withdrawn prematurely (the system waits for demagnetization). Flying restart must be activated if the motor is still rotating.

DC braking by means of fault response continues to be possible.

For p1231 = 14:

In addition to the function for p1231 = 5, binector input p1230 is evaluated.

DC braking is only automatically activated when the speed threshold p1234 is fallen below if binector input p1230 = 1 signal. This is also the case, if no OFF command is present.

After demagnetization and after the time in p1233 has expired, the drive changes back into normal operation or is switched-off (for OFF1/OFF3).

If a 0 signal is applied to binector input p1230, for OFF1 and OFF3 no DC braking is executed.

<b>Dependency:</b>	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)		
<b>Note:</b>	Exiting the Vdc_min control before reaching motor standstill prevents the regenerative braking current from increasing significantly at low speeds, and after a pulse inhibit, means that the motor coasts down. However, the maximum braking torque can be set via the appropriate torque limiting.

<b>Description:</b>	Sets the brake control type (with or without diagnostics evaluation). Example for brake control with diagnostics evaluation. - brake control in the Motor Modules in booksize format - Safe Brake Relay for AC Drive Example for brake control without diagnostics evaluation. - Brake Relay for AC Drive		
<b>Value:</b>	0: Brake control with diagnostics evaluation 1: Brake control without diagnostics evaluation		

**Note:** If the configuration of the motor holding brake (p1215) is set to "no holding brake present" when booting, then an automatic identification of the motor holding brake will be carried out. If a brake control is detected without diagnostics evaluation (e.g. Brake Relay for AC Drive), then the parameter is set to "brake control without diagnostics evaluation".

It is not permissible to parameterize "brake control without diagnostics evaluation" and also enable "safe brake control" (p1278 = 1, p9602 = 1, p9802 = 1).

<b>Description:</b>	Sets the configuration of the controller for the DC link voltage (Vdc controller) in the U/f operating mode.		
<b>Value:</b>	0: Inhib Vdc ctrl 1: Enable Vdc_max controller 2: Enable Vdc_min controller (kinetic buffering) 3: Enable Vdc_min controller and Vdc_max controller		
<b>Dependency:</b>	Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2)		
<b>Note:</b>	For high input voltages (p0210), the following settings can improve the degree of ruggedness of the Vdc_max controller: - set the input voltage as low as possible, and in so doing, avoid A07401 (p0210). - set the rounding times (p1130, p1136). - increase the ramp-down times (p1121). - reduce the integral time of the controller (p1291), factor 0.5. - Activate the Vdc correction in the current controller (p1810.1 = 1) or reduce the derivative action time of the controller (p1292, factor 0.5). In this case, we generally recommend to use vector control (p1300 = 20) (Vdc controller, see p1240). The following measures are suitable to improve the Vdc_min controller: - Optimize the Vdc_min controller (see p1287). - Activate the Vdc correction in the current controller (p1810.1 = 1). If a braking resistor is connected to the DC link (p0219 > 0), then the Vdc_max control is automatically de-activated.

<b>Note:</b>	For bit 00: De-activate the ramp-up for Vdc_min control. For drives with a mechanical system that can oscillate and high moment of inertia, the speed can be more quickly tracked. For bit 02: When the line supply returns, normal operation is resumed earlier, and the system does not wait until the Vdc min controller reaches the setpoint speed.

### 2.2 List of parameters

	21: Speed control (with encoder)
	22: Torque control (encoderless)
	23: Torque control (with encoder)
<b>Dependency:</b>	For Standard Drive Control (p0096 = 1), settings p1300 = 0, 2 are possible, for Dynamic Drive Control (p0096 = 2) only p1300 = 20 can be set. Closed-loop speed or torque control (with encoder) cannot be selected if the encoder type is not entered (p0400). Operation with speed controller is not possible for permanent-magnet synchronous motors. Refer to: p0108, p0300, p0311, p0400, p1501
<b>Notice:</b>	Active slip compensation is required in the U/f control types with Eco mode (p1300 = 4, 7). The scaling of the slip compensation (p1335) should be set so that the slip is completely compensated (generally 100%). The Eco mode is only effective in steady-state operation and when the ramp-function generator is not bypassed. In the case of analog setpoints, if required the tolerance for ramp-up and ramp-down should be actively increased for the ramp-function generator using p1148 in order to reliably signal a steady-state condition.
<b>Note:</b>	The closed-loop torque control can only be changed over in operation (p1300 = 20, 21) by selecting the closed-loop speed control (p1501). At the changeover, the setting of p1300 does not change. In this case, the actual state is displayed in r1407, bit 2 and bit 3.

For bit 04: Field orientation for the closed-loop control of the basis application. The field orientation is activated with the automatic calculation if p0096 is set = 1. For bit 05 (only effective for p1302.4 = 1): The starting current when accelerating (p1311) generally results in an increase in the absolute current and flux. With p1302.5 = 1 the current is only increased in the direction of the load. This setting is recommended for drives with higher power ratings or drives with extremely fast rates of acceleration. For bit 07: For field orientation (bit04 = 1), the Iq,max controller supports the current limiting controller (see p1341). For diagnostic purposes, the Iq,max controller can be de-activated using this bit.

## 2 Parameters

### 2.2 List of parameters

At low output frequencies, there is only a low output voltage in order to maintain the motor flux. However, the output voltage can be too low in order to achieve the following:

- magnetize the induction motor.
- hold the load.
- compensate for losses in the system.

This is the reason that the output voltage can be increased using p1310.

The voltage boost can be used for both linear as well as square-law U/f characteristics.

**Dependency:**

The starting current (voltage boost) is limited by the current limit p0640.

The accuracy of the starting current depends on the setting of the stator and feeder cable resistance (p0350, p0352).

For vector control, the starting current is realized using p1610.

Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2)

Refer to: p1300, p1311, p1312, r1315

**Notice:**

The starting current (voltage boost) increases the motor temperature (particularly at zero speed).

**Note:**

The starting current as a result of the voltage boost is only effective for U/f control (p1300).

The boost values are combined with one another if the permanent voltage boost (p1310) is used in conjunction with other boost parameters (acceleration boost (p1311), voltage boost for starting (p1312)).

However, these parameters are assigned the following priorities: p1310 > p1311, p1312

**Description:**

p1311 only results in a voltage boost when accelerating and generates a supplementary torque to accelerate the load.

The voltage boost becomes effective for a positive setpoint increase and disappears as soon as the setpoint has been reached. The build-up and withdrawal of the voltage boost are smoothed.

The magnitude of the boost in Volt at a frequency of zero is defined as follows (not for field orientation):

Voltage boost [V] = 1.732 \* p0305 (rated motor current [A]) x r0395 (stator/primary section resistance [ohm]) x p1311 (voltage boost when accelerating [%]) / 100 %

**Dependency:**

The current limit p0640 limits the boost.

For field orientation (p1302 bit 4 = 1, not PM230, PM250, PM260), p1311 is pre-assigned by the automatic calculation.

For vector control, the starting current is realized using p1611.

<b>Description:</b>	Sets the setpoint for slip compensation in [%] referred to r0330 (motor rated slip). p1335 = 0.0 %: Slip compensation de-activated. p1335 = 100.0 %: The slip is completely compensated.		
<b>Dependency:</b>	Prerequisite for a precise slip compensation for p1335 = 100 % are the precise motor parameters (p0350 ... p0360). If the parameters are not precisely known, a precise compensation can be achieved by varying p1335. For U/f control types with Eco optimization (4 and 7), the slip compensation must be activated in order to guarantee correct operation. Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2)		
<b>Note:</b>	The purpose of slip compensation is to maintain a constant motor speed regardless of the applied load. The fact that the motor speed decreases with increasing load is a typical characteristic of induction motors. For synchronous motors, this effect does not occur and the parameter has no effect in this case. For the open-loop control modes p1300 = 5 and 6 (textile sector), the slip compensation is internally disabled in order to be able to precisely set the output frequency. If p1335 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1335 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300).

## 2 Parameters

### 2.2 List of parameters

**Note:** The resonance damping function dampens active current oscillations that frequency occur under no-load conditions. The resonance damping is active in a range from approximately 6 % of the rated motor frequency (p0310). The shutoff frequency is determined by p1349.  
For the open-loop control modes p1300 = 5 and 6 (textile sectors), the resonance damping is internally disabled in order that the output frequency can be precisely set.

**Description:** Sets the proportional gain of the I\_max frequency controller.  
The I\_max controller reduces the drive converter output current if the maximum current (r0067) is exceeded. In the U/f operating modes (p1300) for the I\_max control, one controller is used that acts on the output frequency and one controller that acts on the output voltage. The frequency controller reduces the current by decreasing the converter output frequency. The frequency is reduced down to a minimum value (equaling twice rated slip). If the overcurrent condition cannot be successfully resolved using this measure, then the drive converter output voltage is reduced using the I\_max voltage controller. Once the overcurrent condition has been resolved, the drive is accelerated along the ramp set in p1120 (ramp-up time).  
**Dependency:** In the U/f modes (p1300) for textile applications and for external voltage setpoints, only the I\_max voltage controller is used.  
Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2)  
**Notice:** When de-activating the I\_max controller, the following must be carefully observed:  
When the maximum current (r0067) is exceeded, the output current is no longer reduced. The drive is switched off when the overcurrent limits are exceeded.  
**Note:** The I\_max limiting controller becomes ineffective if the ramp-function generator is de-activated with p1122 = 1. p1341 = 0:  
I\_max frequency controller de-activated and I\_max voltage controller activated over the complete speed range.

In the case of power units with regenerative feedback (PM250, PM260), current limitation control for a regenerative load is always implemented by influencing the frequency. This current limiting function is de-activated with p1340 = p1341 = 0.

<b>Note:</b>	For bit 00 (not for permanent-magnet synchronous motors): Initially, the flux is only established with a low rate of rise when magnetizing the induction motor. The flux setpoint p1570 is reached again at the end of the magnetizing time p0346.				
	For bit 01 (not for permanent-magnet synchronous motors): Initially, the flux is only established with a low rate of rise when magnetizing the induction motor. The flux setpoint p1570 is reached again at the end of the magnetizing time p0346. When quick magnetizing (p1401.6 = 1) is selected, soft starting is internally de-activated and alarm A07416 is displayed.				
	The flux differentiation can be switched out if a significant ripple occurs in the field-generating current setpoint (r0075) when entering the field weakening range. However, this is not suitable for fast acceleration operations because then, the flux decays more slowly and the voltage limiting responds.				
	For bit 02 (not for permanent-magnet synchronous motors): The flux build-up control operates during the magnetizing phase p0346 of the induction motor. If it is switched out, a constant current setpoint is injected and the flux is built up corresponding to the rotor time constant. When quick magnetizing (p1401.6 = 1) is selected and when flux build-up control is de-energized alarm A07416 is displayed.				
	For bit 06 (not for induction motors): Magnetizing is performed with maximum current (0.9 * r0067). With active identification of the stator resistance (see p0621) quick magnetizing is internally de-activated and alarm A07416 is displayed. During a flying restart of a rotating motor (see p1200) no quick magnetizing takes place.				
	For bit 07: if the speed of the drive exceeds the effective speed limit of the speed limiting controller, the torque limit is reduced linearly to zero as the deviation becomes greater. This reduces the integral component of the speed controller and, in turn, the overshoot during load shedding (see also F07901 and p2162).

<b>Description:</b>	Sets the signal source for the speed actual value of the speed controller.		
<b>Dependency:</b>	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1) Refer to: r1443		
<b>Caution:</b>	Speed control with encoder (p1300 = 21): For the speed or position signal of the motor model there must always be a motor encoder available (evaluation via SMC/SMI, see p0400). The actual speed of the motor (r0061) and the position data for synchronous motors continue to come from this motor encoder and are not affected by the setting of p1440. Interconnection of p1440: If connector input p1440 is interconnected with an external speed actual value, the identical scaling of the speed should be observed (p2000).		
			
<b>Notice:</b>	If the speed signal is made available via blocks which can be interconnected freely, its sampling time should not exceed that of the closed-loop speed controller (p0115[1]) and the calculation "PRIOR TO closed-loop speed controller" should be made. in order that for a motor speed encoder fault, a changeover can be made to encoderless operation (see p0491), the speed signal, if it is derived from its own motor speed encoder, must be used from r0063 and not from r0061.

<b>Description:</b>	Sets the upper adaptation speed of the speed controller. No adaptation is effective above this speed. For the proportional gain, p1470 x p1461 is effective. For the integral time, p1472 x p1463 is effective.

<b>Note:</b>	If the upper transition point p1465 of the speed controller adaptation is set to lower values than the lower transition point p1464, then the controller below p1465 is adapted with p1461 or p1463. This means that an adaptation can be implemented for low speeds without having to change the controller parameters.

**Description:** Sets the signal source for the torque setting value when starting up with motor holding brake.

**Recommendation:** To hold the actual torque when stopping the motor, you are advised to set p1400 bit 1 = 1. As a result, the integral component of the speed controller is frozen when changing to the open-loop controlled operating range.

**Dependency:** The switching in of the torque setting value for the motor holding brake has a higher priority than the setting of the integrator value using p1477 and p1478.

**Note:** Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)

The setting of the integral output of the speed controller begins after magnetizing (see p0346, r0056 bit 4) and ends at the end of the brake control opening time p1216. A setting value of zero means that no setting procedure will take place.

If p1351 is used as a signal source for the torque setting value, the percentage value is interpreted in relation to the rated torque (p2003).

**Description:** Sets the signal source for the integrator setting value for the velocity controller.

The signal to set this integrator setting value is interconnected via p1477.

**Dependency:** The setting value of the speed controller integrator is weighted with the scaling factor of the signal source in p1479.

If p1478 is interconnected to the integral output of the speed controller (r1482), then after the magnetizing time (r0346) and if the speed controller is enabled, the integral component of the controller is set to the last value before the pulse inhibit. This value is set if no setting command (p1477) is interconnected or, at the instant that the pulses were inhibited, a setting command is available, which is not de-activated up to the next time that the pulses are inhibited. For sensorless vector control, in addition p1400.1 should be set to 1 so that when the drive is stopped, the integral component of the speed controller is not controlled down to zero.

In order that when setting the integrator output, only the static torque is detected, we recommend that the accelerating torque is completely pre-controlled (e.g. p1496).

If p1478 is interconnected to another output other than r1482, then after magnetizing and speed controller enable, the integral output is set once if the setting command is not interconnected (p1477 = 0).

Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1), "Dynamic Drive Control" (DDC, p0096 = 2)

<b>Description:</b>	Sets the source for droop feedback. With increasing torque, the speed setpoint is reduced (enabled using p1492), so that for mechanically coupled drives a load equalization (load compensation) is obtained. A load difference compensation is also possible, if p1486 is interconnected with the torque setpoint of the other drive.		

<b>Value:</b>	0: Droop feedback not connected 1: Droop from torque setpoint 2: Droop from speed controller output 3: Droop from integral output speed controller
<b>Dependency:</b>	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1), "Dynamic Drive Control" (DDC, p0096 = 2) Refer to: p1486, p1487, p1489, r1490, p1492

**Caution:**

For active acceleration precontrol of the speed controller (refer to p1496), it is not recommended that p1488 is set to 1, as this could result in positive coupling effects. Instead of this, as source of the droop feedback, the output signal of the speed controller should be used, which generally sets the load torque.

<b>Dependency:</b>	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1) Refer to: p0341, p0342		
<b>Warning:</b>	The acceleration precontrol r1518 is kept at the old value if the ramp-function generator tracking (r1199.5) is active or the ramp-function generator output is set (r1199.3). This is used to avoid torque peaks. Depending on the application, it may therefore be necessary to disable the ramp-function generator tracking (p1145 = 0) or the acceleration precontrol (p1496 = 0). The acceleration precontrol is set to zero, if the Vdc control is active (r0056.14/15).		
			
<b>Note:</b>	The parameter is set to 100% by the rotating measurement (refer to p1960). The acceleration pre-control may not be used if the speed setpoint manifests significant ripple (e.g. analog setpoint) and the rounding-off in the speed ramp-function generator is disabled. We also recommend that the pre-control mode is not used if there is gearbox backlash.

<b>Note:</b>	In the field weakening range, it must be expected that the control dynamic performance is somewhat restricted due to the limited possibilities of controlling/adjusting the voltage. <b>Min</b>	<b>Max</b>	<b>Factory setting</b>
-200.0 [%]	200.0 [%]	50.0 [%]

**Description:** Sets the static torque setpoint for sensorless vector control in the low speed range. This parameter is entered as a percentage referred to the rated motor torque (r0333). For sensorless vector control, when the motor model is shut down, an absolute current is impressed. p1610 represents the maximum load that occurs at a constant setpoint speed.

**Dependency:** Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)

**Notice:** p1610 should always be set to at least 10 % higher than the maximum steady-state load that can occur.

**Note:** For p1610 = 0%, a current setpoint is calculated that corresponds to the no-load case (ASM: rated magnetizing current, RESM: no-load magnetizing current).

For p1610 = 100 %, a current setpoint is calculated that corresponds to the rated motor torque.

Negative values are converted into positive setpoints in the case of induction and permanent-magnet synchronous motors as well as closed-loop controlled reluctance motors.

**Dependency:** Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)

**Note:** When accelerating and braking p1611 is added to p1610 and the resulting total torque is converted into an appropriate current setpoint and controlled.

For pure accelerating torques, it is always favorable to use the torque pre-control of the speed controller (p1496).

**Description:** Displays the actual maximum possible electromotive force (EMF) of the separately-excited synchronous motor.

**Dependency:** The value is the basis for the flux setpoint.

The maximum possible EMF depends on the following factors:

- Actual DC link voltage (r0070).

- Maximum modulation depth (p1803).

- Field-generating and torque-generating current setpoint.

**Description:** Sets the speed threshold for de-activating the integral component of the Isd controller.

The d current controller is only effective as P controller for speeds greater than the threshold value. Instead of the integral component, the quadrature arm decoupling is effective.

**Dependency:** Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1), "Dynamic Drive Control" (DDC, p0096 = 2)

**Warning:**

For settings above 80%, the d current controller is active up to the field weakening limit. When operated at the voltage limit, this can result in an unstable behavior. In order to avoid this, the dynamic voltage reserve p1574 should be increased.

**Note:** The parameter value is referred to the synchronous rated motor speed.

**Dependency:**

Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)  
Refer to: p0500

**Caution:**

Do not use bit 6 = 1 if the motor can be slowly reversed by the load at the torque limit. Long delay times due to blocking (p2177 > p1758) can cause the motor to stall. In this case you should de-activate the function or use closed-loop control throughout the speed range (note the information re bit 2 = 1).

**Note:**

Bits 0 ... 2 only have an influence for encoderless vector control, bit 2 is pre-assigned depending on p0500.

For bit 2 = 1:

The sensorless vector control is effective down to zero frequency. A change is not made into the open-loop speed controlled mode.

This operating mode is possible for passive loads. These include applications where the load itself does not generate any active torque and therefore only acts reactively to the drive torque of the induction motor.

If bit 2 = 1, then bit 3 is automatically set to 1. Manual de-selection is possible and may be sensible if the saturation characteristic (p1960) was not measured for third-party motors. Generally, for standard SIEMENS motors, the already pre-assigned (default value) saturation characteristic is adequate.

When the bit is set, the selection of bits 0 and 1 is ignored.

For bit 2 = 0:

Bit 3 is also automatically de-activated.

For bit 6 = 1:

The following applies for encoderless vector control of induction motors:

For a blocked motor (see p2175, p2177) the time condition in p1758 is bypassed and a change is not made into open-loop controlled operation.

The following applies for encoderless vector control of synchronous motors:

For a blocked motor (see p2175, p2177), the speed ramp-function generator is held in open-loop speed controlled operation, and a change is not made into closed-loop controlled operation.

For bit 7 = 1:

The following applies for encoderless vector control of induction motors:

If the changeover limits are parameterized too low (p1755, p1756), then they are automatically increased to rugged values by the absolute amount p1749 \* p1755.

The effective time condition for changing over into open-controlled operation is obtained from the minimum value of p1758 and  $0.5 * r0384$ .

It is recommended that bit 7 is activated for applications that demand a high torque at low frequencies, and at the same time require low speed gradients..

Adequate parameterization of the current setpoint must be ensured (p1610, p1611).

**Dependency:** Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)

**Note:** For bit 17:

Displays the enabled status of the rugged model feedback (p1784).

The feedback is used to increase the parameter ruggedness of the motor model and is effective in the operating range of the two-component closed loop current control.

For bit 18:

Displays the status when enabling the differential current feedback in the current model for operation with encoder.

The function is automatically enabled with  $p1784 > 0$  or  $p1731 > 0$ . The feedback is used for a rugged change between the current model and complete machine model with active rugged model feedback and combination current.

For bit 19:

Displays the currently active stator circuit feedback in current model operation.

For bit 20:

Displays the currently effective increase of the changeover limits by the value  $p1749 * p1755$ .

For bit 21:

For a blocked synchronous motor, the speed ramp-function generator is held in the open-loop speed controlled operating range if the torque setpoint reaches the torque limit and the speed is less than the threshold value in p2175.

13	Fast pulsed pole position identification	Yes	No	-
14	Delay of the precontrol speed to the motor model	Yes	No	-
15	RESM Q flux model linear active	Yes	No	-

**Dependency:** In U/f characteristic operating mode only bit 7 is relevant.

For active motor model feedback (see p1784), the Lh adaptation is internally de-activated automatically.

**Note:** ASM: Induction motor

PMSM: permanent-magnet synchronous motor

When selecting the compensation of the valve interlocking via Rs (bit 7), the compensation in the gating unit is de-activated and is instead taken into account in the motor model.

In order that the correction values of the Rs, Lh and kT adaptation (selected using Bit 0 ... Bit 2) are correctly accepted when changing over the drive data set, a dedicated motor number must be entered into p0826 for each different motor.

For bit 12 (only for synchronous motors and bit 6 = 1):

The pole position identification is only carried out after power on and after the motor has coasted down. The switch-off speed p1226 should be as low as possible. If the power unit is switched off when the motor is stationary, then the next time that the power unit is switched on, the old angle is used as starting value. The precondition applies that while the power unit is switched off the motor does not rotate.

The duration of the pole position identification is shortened using bit 13. As a consequence, the pole wheel angle error can be slightly greater.

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
2.000 [kHz]	16.000 [kHz]	4.000 [kHz]

**Description:** Sets the pulse frequency for the converter.

This parameter is pre-set to the rated converter value when the drive is first commissioned.

**Dependency:** Refer to: p0230

**Note:** The maximum and minimum possible pulse frequency is also determined by the power unit being used (minimum pulse frequency: 2 kHz or 4 kHz).

When the pulse frequency is increased, depending on the particular power unit, the maximum output current can be reduced (derating, refer to r0067).

If a sine-wave filter is parameterized as output filter (p0230 = 3), then the pulse frequency cannot be set below the minimum value required for the filter.

For operation with output reactors, the pulse frequency is limited to 4 kHz (see p0230).

If p1800 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1800 have been changed by a parameter that was set when the drive was commissioned (e.g. p1082).

2: Space vector modulation (SVM)  
3: SVM without overcontrol  
4: SVM/FLB without overcontrol  
10: SVM/FLB with modulation depth reduction

**Dependency:** If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), then only space vector modulation without overcontrol can be selected as modulation type (p1802 = 3). This does not apply to power units PM260.

p1802 = 10 can only be set for power units PM230 and PM240 and for r0204.15 = 0.

Refer to: p0230, p0500

**Note:** When modulation modes are enabled that could lead to overmodulation (p1802 = 0, 2, 10), the modulation depth must be limited using p1803 (default, p1803 < 100 %). The higher the overmodulation, the greater the current ripple and torque ripple.

When changing p1802[x], the values for all of the other existing indices are also changed.

<b>Notice:</b>	Bit 1 = 1 can only be set under a pulse inhibit and for r0192.14 = 1.				
<b>Note:</b>	For bit 00 = 0: Voltage limitation from the minimum of the DC link voltage (lower ripple in the output current, reduced output voltage). For bit 00 = 1: Voltage limitation from averaged DC link voltage (higher output voltage with increased ripple in the output current). The selection is only valid if the DC link compensation is not performed in the Control Unit (bit 1 = 0). For bit 01 = 0: DC link voltage compensation in the modulator. For bit 01 = 1: DC link voltage compensation in the current control.

<b>Description:</b>	Sets the phase sequence reversal for the motor without setpoint change. If the motor does not rotate in the required direction, then the output phase sequence can be reversed using this parameter. This means that the direction of the motor is reversed without the setpoint being changed.		
<b>Value:</b>	0: OFF 1: ON		

**Caution:**

For operation with encoder, if the output phase sequence is changed, under certain circumstances it may be necessary to change the direction of rotation for the encoder (see p0410).

The encoder polarity is also checked for the rotating measurement (see p1959).

**Note:**

This setting can only be changed when the pulses are inhibited.

**Description:** Sets the motor data identification and speed controller optimization.  
The motor identification should first be performed with the motor stationary (p1900 = 1, 2; also refer to p1910). Based on this, additional motor and control parameters can be determined using the motor data identification with the motor rotating (p1900 = 1, 3; also refer to p1960; not for p1300 < 20).

When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next switch-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.  
With the following switch-on command, a rotating motor data identification routine is carried out - and in addition, a speed controller optimization by making measurements at different motor speeds.

p1900 = 2:

Sets p1910 = 1 and p1960 = 0

When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next switch-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.

p1900 = 3:

Sets p1960 = 0, 1 depending on p1300

This setting should only be selected if the motor data identification was already carried out at standstill.

When the drive enable signals are present, with the next switch-on command, a rotating motor data identification routine is carried out - and in addition, speed controller optimization by taking measurements at different motor speeds.

p1900 = 11, 12:

The same as p1900 = 1, 2 with the difference, that after the measurement, the system immediately goes into operation. For this purpose, p1909.18 is set = p1959.13 is set = 1 .

<b>Value:</b>	0: Inhibited
	1: Identifying motor data and optimizing the speed controller
	2: Identifying motor data (at standstill)
	3: Optimizing the speed controller (in rotating operation)
	11: Motor data ident. and speed controller opt., switch to operation
	12: Motor data identification (at standstill), switch to operation

**Dependency:** Refer to: p1300, p1910, p1960

Refer to: A07980, A07981, F07983, F07984, F07985, F07986, F07988, F07990, A07991

**Notice:** p1900 = 3:

This setting should only be selected if the motor data identification was already carried out at standstill.

If there is a motor holding brake, it must be open (p1215 = 2).

To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971).

During the rotating measurement it is not possible to save the parameter (p0971).

For p0014 = 1, the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** The motor and control parameters of the vector control are only optimally set when both measurements are carried out (initially at standstill, and then with the motor rotating). The measurement with rotating motor is not performed for p1300 < 20 (U/f controls).

An appropriate alarm is output when the parameter is set.

The switch-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it.

The duration of the measurements can lie between 0.3 s and several minutes. This time is, for example, influenced by the motor size and the mechanical conditions.

p1900 is automatically set to 0 after the motor data identification routine has been completed.

If a reluctance motor has been parameterized, a pole position identification is carried out during the stationary measurement. As a consequence, faults that occur can also be assigned to the pole position identification.

p1900 = 2:

Sets p1910 = 1 and p1960 = 0

When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next switch-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.

p1900 = 3:

Sets p1960 = 0, 1 depending on p1300

This setting should only be selected if the motor data identification was already carried out at standstill.

When the drive enable signals are present, with the next switch-on command, a rotating motor data identification routine is carried out - and in addition, speed controller optimization by taking measurements at different motor speeds.

**Value:**

- 0: Inhibited
- 1: Identifying motor data and optimizing the speed controller
- 2: Identifying motor data (at standstill)
- 3: Optimizing the speed controller (in rotating operation)

**Dependency:**

Refer to: p1300, p1910, p1960

**Notice:**

p1900 = 3:

This setting should only be selected if the motor data identification was already carried out at standstill.

If there is a motor holding brake, it must be open (p1215 = 2).

To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971).

During the rotating measurement it is not possible to save the parameter (p0971).

For p0014 = 1, the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:**

The motor and control parameters of the vector control are only optimally set when both measurements are carried out (initially at standstill, and then with the motor rotating). The measurement with rotating motor is not performed for p1300 < 20 (U/f controls).

An appropriate alarm is output when the parameter is set.

The switch-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it.

The duration of the measurements can lie between 0.3 s and several minutes. This time is, for example, influenced by the motor size and the mechanical conditions.

p1900 is automatically set to 0 after the motor data identification routine has been completed.

If a reluctance motor has been parameterized, a pole position identification is carried out during the stationary measurement. As a consequence, faults that occur can also be assigned to the pole position identification.

Without de-selection in bit 11, in the closed-loop control mode, the direct inductance LD and the quadrature inductance Lq are measured at a low current.

When de-selecting with bit 11 or in the U/f mode, the stator inductance is measured at half the rated motor current.

If the stator inductance is not measured but is to be estimated, then bit 0 should be set and bit 11 should be de-selected.

Bit 19 = 1:

All parameters are automatically saved after a successful motor data identification.

If a speed controller optimization run is then selected, the parameters are only saved after this measurement has been completed.

Bit 22 = 1:

**Description:**

Sets the motor data identification routine.

The motor data identification routine is carried out after the next switch-on command.

p1910 = 1:

All motor data and the drive converter characteristics are identified and then transferred to the following parameters:

p0350, p0354, p0356, p0357, p0358, p0360, p1825, p1828, p1829, p1830

After this, the control parameter p0340 = 3 is automatically calculated.

p1910 = 20:

Only for internal SIEMENS use.

**Dependency:**

"Quick commissioning" must be carried out (p0010 = 1, p3900 > 0) before executing the motor data identification routine!

When selecting the motor data identification routine, the drive data set changeover is suppressed.

Refer to: p1900

Refer to: F07990, A07991

- Notice:** After the motor data identification (p1910 > 0) has been selected, alarm A07991 is output and a motor data identification routine is carried out as follows at the next switch-on command:
- current flows through the motor and a voltage is present at the drive converter output terminals.
  - during the identification routine, the motor shaft can rotate through a maximum of half a revolution.
  - however, no torque torque is generated.
- Note:** If there is a motor holding brake, it must be open (p1215 = 2).  
To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971).  
When setting p1910, the following should be observed:
1. "With acceptance" means:  
The parameters specified in the description are overwritten with the identified values and therefore have an influence on the controller setting.
  2. "Without acceptance" means:  
The identified parameters are only displayed in the range r1912 ... r1926 (service parameters). The controller settings remain unchanged.
  3. For settings 27 and 28, the AVC configuration set using p1840 is active.  
The switch-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it. The duration of the measurements can lie between 0.3 s and several minutes. This time is mainly influenced by the motor size. At the end of the motor data identification, p1910 is automatically set to 0, if only the stationary measurement is selected, then p1900 is also reset to 0, otherwise, the rotating measurement is activated.

**Description:**

Sets the rotating measurement.

The rotating measurement is carried out after the next switch-on command.

The setting possibilities of the parameter depend on the open-loop/closed-loop control mode (p1300).

p1300 < 20 (U/f open-loop control):

It is not possible to select rotating measurement or speed controller optimization.

p1300 = 20, 22 (encoderless operation):

Only rotating measurement or speed controller optimization can be selected in the encoderless mode.

p1300 = 21, 23 (operation with encoder):

Both versions (encoderless and with encoder) of the rotating measurement and speed controller optimization can be selected.

**Value:**

- 0: Inhibited
- 1: Rotating measurement in encoderless operation
- 2: Rotating measurement with encoder
- 3: Speed controller optimization in encoderless operation
- 4: Speed controller optimization with encoder

**Dependency:**

Before the rotating measurement is carried out, the motor data identification routine (p1900, p1910, r3925) should have already been done.

When selecting the rotating measurement, the drive data set changeover is suppressed.

Refer to: p1300, p1900, p1959, p1967, r1968

**Danger:**

For drives with a mechanical system that limits the distance moved, it must be ensured that this is not reached during the rotating measurement. If this is not the case, then it is not permissible that the measurement is carried out.

**Notice:**

If there is a motor holding brake, it must be open (p1215 = 2).

To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971).

During the rotating measurement it is not possible to save the parameter (p0971).

**Note:**

When the rotating measurement is activated, it is not possible to save the parameters (p0971).

Parameter changes are automatically made for the rotating measurement (e.g. p1120); this is the reason that up to the end of the measurement, and if no faults are present, no manual changes should be made.

The ramp-up and ramp-down times (p1120, p1121) are limited, for the rotating measurement, to 900 s.

For speed controller optimization with encoder (p1960 = 2, 4), the speed controller for encoderless operation is also pre-assigned (p1470, p1472).

Depending on whether the speed controller optimization is carried out with or without encoder, different Kp/Tn adaptations of the speed controller are set (p1464, p1465). If the drive should be controlled with as well as without speed encoder, then we recommend the use of two drive data sets (p0180). These can then be executed with different speed controller adaptations.

If the actual dynamic response (see r1968) is significantly reduced with respect to the required dynamic response (p1967), then this can be as a result of mechanical load oscillations. If, in spite of this load behavior, a higher dynamic response is required, then the oscillation test (p1959.4 = 0) should be de-activated and the measurement repeated.

## 2 Parameters

### 2.2 List of parameters

All speeds or frequencies specified as relative value are referred to this reference quantity.

The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

The following applies: Reference frequency (in Hz) = reference speed (in ((rpm) / 60) x pole pair number)

**Dependency:**

This parameter is only updated during the automatic calculation (p0340 = 1, p3900 > 0) if motor commissioning was carried out beforehand for drive data set zero. This means that the parameter is not locked against overwriting using p0573 = 1.

Refer to: p2001, p2002, p2003, r2004, r3996

**Notice:**

When the reference speed / reference frequency is changed, short-term communication interruptions may occur.

**Note:**

If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.

Example 1:

The signal of an analog input (e.g. r0755[0]) is connected to a speed setpoint (e.g. p1070[0]). The actual percentage input value is cyclically converted into the absolute speed setpoint using the reference speed (p2000).

Example 2:

The setpoint from PROFIBUS (r2050[1]) is connected to a speed setpoint (e.g. p1070[0]). The actual input value is cyclically converted into a percentage value via the pre-specified scaling 4000 hex. This percentage value is converted to the absolute speed setpoint via reference speed (p2000).

#### Reference voltage / Reference voltage

<b>Access level:</b> 3	<b>Calculated:</b> p0340 = 1	<b>Data type:</b> FloatingPoint32
<b>Can be changed:</b> T	<b>Scaling:</b> -	<b>Dyn. index:</b> -
<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
10 [Vrms]	100000 [Vrms]	1000 [Vrms]

**Description:**

Sets the reference quantity for voltages.

All voltages specified as relative value are referred to this reference quantity. This also applies for direct voltage values (= rms value) like the DC-link voltage.

The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

Note:

This reference quantity also applies to direct voltage values. It is not interpreted as rms value, but as DC voltage value.

**Dependency:**

p2001 is only updated during automatic calculation (p0340 = 1, p3900 > 0) if motor commissioning has been carried out first for drive data set zero and as a result overwriting of the parameter has not been blocked by setting p0573 = 1.

Refer to: r3996

**Notice:**

When the reference voltage is changed, short-term communication interruptions may occur.

**Note:**

If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.

For infeed units, the parameterized device supply voltage (p0210) is pre-assigned as the reference quantity.

Example:

The actual value of the DC link voltage (r0070) is connected to a test socket (e.g. p0771[0]). The actual voltage value is cyclically converted into a percentage of the reference voltage (p2001) and output according to the parameterized scaling.

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0.10 [Arms]	100000.00 [Arms]	100.00 [Arms]

**Description:**

Sets the reference quantity for currents.

All currents specified as relative value are referred to this reference quantity.

The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

**Dependency:**

This parameter is only updated during the automatic calculation (p0340 = 1, p3900 > 0) if motor commissioning was carried out beforehand for drive data set zero. This means that the parameter is not locked against overwriting using p0573 = 1.

Refer to: r3996

- Notice:** If various DDS are used with different motor data, then the reference quantities remain the same as these are not changed over with the DDS. The resulting conversion factor must be taken into account.
- Example:  
 p2002 = 100 A  
 Reference quantity 100 A corresponds to 100 %  
 p0305[0] = 100 A  
 Rated motor current 100 A for MDS0 in DDS0 --> 100 % corresponds to 100 % of the rated motor current  
 p0305[1] = 50 A  
 Rated motor current 50 A for MDS1 in DDS1 --> 100 % corresponds to 200 % of the rated motor current  
 When the reference current is changed, short-term communication interruptions may occur.
- Note:** Pre-assigned value is p0640.
- If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.
- For infeed units, the rated line current, which is obtained from the rated power and parameterized rated line supply voltage ( $p2002 = r0206 / p0210 / 1.73$ ) is pre-assigned as the reference quantity.
- Example:  
 The actual value of a phase current (r0069[0]) is connected to a test socket (e.g. p0771[0]). The actual current value is cyclically converted into a percentage of the reference current (p2002) and output according to the parameterized scaling.

	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	2	0

**Description:** Sets the processing mode for PROFdrive STW1.10 "master control by PLC". Generally, control word 1 is received with the first receive word (PZD1) (this is in conformance to the PROFdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.

**Value:**  
 0: Freeze setpoints and continue to process sign-of-life  
 1: Freeze setpoints and sign-of-life  
 2: Do not freeze setpoints

**Recommendation:** Do not change the setting p2037 = 0.

**Note:** If the STW1 is not transferred according to the PROFdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.

	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	2	0

**Description:** Sets the interface mode of the PROFdrive control words and status words. When selecting a telegram via p0922 (p2079), this parameter influences the device-specific assignment of the bits in the control and status words.

**Value:**  
 0: SINAMICS  
 2: VIK-NAMUR

**Dependency:** Refer to: p0922, p2079

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:**  
 - For p0922 (p2079) = 1, 350 ... 999, p2038 is automatically set to 0.  
 - For p0922 (p2079) = 20, p2038 is automatically set to 2.  
 It is not then possible to change p2038.

<b>Description:</b>	Sets the fault response for the selected fault.		
<b>Value:</b>	0: NONE 1: OFF1 2: OFF2 3: OFF3 5: STOP2 6: Internal armature short-circuit / DC braking		
<b>Dependency:</b>	The fault is selected and the required response is set under the same index. Refer to: p2100		
<b>Notice:</b>	For the following cases, it is not possible to re-parameterize the fault response to a fault: - fault number does not exist (exception value = 0). - Message type is not "fault" (F). - fault response is not permissible for the set fault number.		
<b>Note:</b>	Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved. The fault response can only be changed for faults with the appropriate identification. Example: F12345 and fault response = NONE (OFF1, OFF2) --> The fault response NONE can be changed to OFF1 or OFF2. For value = 1 (OFF1): Braking along the ramp-function generator down ramp followed by a pulse inhibit. For value = 2 (OFF2): Internal/external pulse inhibit. For value = 3 (OFF3): Braking along the OFF3 down ramp followed by a pulse inhibit. For value = 5 (STOP2): n_set = 0 For value = 6 (armature short-circuit, internal/DC braking): This value can only be set for all drive data sets when p1231 = 4. a) DC braking is not possible for synchronous motors. b) DC braking is possible for induction motors.

<b>Note:</b>	For bit 03, 07: These bits are set if at least one fault/alarm occurs. Data is entered into the fault/alarm buffer with delay. This is the reason that the fault/alarm buffer should only be read if, after "fault present" or "alarm present" has occurred, a change in the buffer was also detected (r0944, r9744, r2121). For bit 06, 08: These status bits are used for internal diagnostic purposes only. For bit 11, 12: These status bits are used for the classification of internal alarm classes and are intended for diagnostic purposes only on certain automation systems with integrated SINAMICS functionality.

<b>Notice:</b>	For p0322 = 0, the following applies: p2162 <= 0.1 * p0311 For p0322 > 0, the following applies: p2162 <= 1.02 * p0322 - p1082 If one of the conditions is violated, p2162 is appropriately and automatically reduced when exiting the commissioning mode.		
<b>Note:</b>	For a negative speed limit (r1087) the hysteresis is effective below the limit value and for a positive speed limit (r1084) above the limit value. If significant overshoot occurs in the maximum speed range (e.g. due to load shedding), you are advised to increase the dynamic response of the speed controller (if possible). If this is insufficient, the hysteresis p2162 can only be increased by more than 10% of the rated speed when the maximum speed (p0322) of the motor is sufficiently greater than the speed limit p1082.

	<b>Min</b> 0.000 [s]	<b>Max</b> 65.000 [s]	<b>Factory setting</b> 3.000 [s]
<b>Description:</b>	Sets the delay time for the message "Motor blocked" (BO: r2198.6).		
<b>Dependency:</b>	Refer to: p0500, p2175, r2198 Refer to: F07900		
<b>Note:</b>	The following applies for sensorless vector control: At low speeds a locked motor can only be detected if no change is made to open-loop speed controlled operation. If this is the case, the value in p2177 must be reduced accordingly (p2177 < p1758) before time p2177 has elapsed in order to detect the locked state reliably. As countermeasure, it is generally also possible to set p1750.6. This is only not permitted if the drive is slowly reversed by the load at the torque limit (speed below p1755 for longer than p1758).		
<b>p2178[0...n]</b>	<b>Motor stalled delay time / Mot stall t_del</b>

	<b>Min</b> 0.000 [s]	<b>Max</b> 10.000 [s]	<b>Factory setting</b> 0.010 [s]
<b>Description:</b>	Sets the delay time for the message "Motor stalled" (BO: r2198.7).		
<b>Dependency:</b>	Refer to: r2198		
<b>Note:</b>	In the open-loop speed controlled operating range (see p1755, p1756), vector control stall monitoring depends on threshold p1745. At higher speeds, the difference between flux setpoint r0083 and flux actual value r0084 is monitored.

CU250S_V_PN (Ext msg)	<b>Min</b> 0.00 [Arms]	<b>Max</b> 1000.00 [Arms]	<b>Factory setting</b> 0.00 [Arms]
<b>Description:</b>	Sets the current limit for output load identification. A missing output load is displayed using the "Output load not available" message (r2197.11 = 1). This message is output with a delay time (p2180).		
<b>Dependency:</b>	Refer to: p2180		
<b>Notice:</b>	For synchronous motors the output current can be almost zero under no load conditions.		
<b>Note:</b>	Missing output load is signaled in the following cases: - the motor is not connected. - a phase failure has occurred.

## 2 Parameters

### 2.2 List of parameters

For bit 05:

The threshold value is set in p1226 and the delay time in p1228.

For bit 06:

The hysteresis is set in p2162.

For bit 07:

The threshold value is set in p2163 and the hysteresis is set in p2164.

For bit 08:

The threshold value is set in p2170 and the delay time in p2171.

For bit 09, 10:

The threshold value is set in p2172 and the delay time in p2173.

For bit 11:

The threshold value is set in p2179 and the delay time in p2180.

For bit 12:

The threshold value is set in p2182, the hysteresis in p2162, and the delay time (for canceling the signal) in p2152.

For bit 13:

Only for internal Siemens use.

05	Ramp-up/ramp-down completed	Yes	No	8011
11	Torque utilization < torque threshold value 2	Yes	No	8012

**Note:**

For bit 00:

The speed threshold value 3 is set in p2161.

For bit 01:

The comparison value is set in p2141. We recommend setting the hysteresis (p2142) for canceling the bit to a value lower than that in p2141. Otherwise, the bit is not reset.

For bit 11:

The torque threshold value 2 is set in p2194.

	04	Ramp-function generator always active	Yes	No	-
<b>Dependency:</b>	Refer to: r2231, p2240				
<b>Notice:</b>	For p0014 = 1, the following applies: After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.				

**Note:** For bit 00:  
 0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p2240.  
 1: The setpoint for the motorized potentiometer is saved and after ON is entered using r2231. In order to save in a non-volatile fashion, bit 03 should be set to 1.  
 For bit 02:  
 0: Without initial rounding-off  
 1: With initial rounding-off.  
 The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed). The jerk for initial rounding is independent of the ramp-up time and only depends on the selected maximum value (p2237).  
 It is calculated as follows:  

$$r = 0.0001 \times \max(p2237, |p2238|) [\%] / 0.13^2 [s^2]$$
  
 The jerk is effective until the maximum acceleration is reached ( $a_{max} = p2237 [\%] / p2247 [s]$  or  $a_{max} = p2238 [\%] / p2248 [s]$ ), after which the drive continues to run linearly with constant acceleration.  
 The higher the maximum acceleration (the lower that p2247 is), the longer the ramp-up time increases with respect to the set ramp-up time.  
 For bit 03:  
 0: Non-volatile data save de-activated.  
 1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for p2230.0 = 1).  
 For bit 04:  
 When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r2250.

**Description:** Sets the configuration of the technology controller.

<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	04	Ramp-up/ramp-down function generator bypass	De-activated	Activated	-
	05	Integrator active for skip speeds	Yes	No	-
	06	Internal controller limit not displayed	Yes	No	-

**Dependency:** For bit 04 = 0:  
The setting is only effective when the PID controller is de-activated.  
Refer to: p2280, p2285

**Caution:** For bit 04 = 1 (p2251 = 0):  
The PID controller can oscillate if the ramp-up and ramp-down times of the speed setpoint channel are not taken into account when setting controller parameters p2280 and p2285.

**Note:** For bit 04 = 0 (only for p2251 = 0):  
The ramp-function generator in the speed setpoint channel is bypassed when the technology controller is operational.

As a consequence, ramp times p1120, p1121 are not taken into consideration when configuring the controller.

For bit 04 = 1 (only for p2251 = 0):  
The ramp-function generator in the speed setpoint channel is not bypassed when the technology controller is operational.

As a consequence, the ramp-up and ramp-down times (p1120, p1121) remain effective, and must be taken into account as controlled system variables when setting the PID controller parameters (p2280, p2285).

The enable ramps of the PID controller are ensured in this setting by p1120, p1121 as well as rounding functions p1130 and p1131. The ramp-up/ramp-down time of the PID controller limiting p2293 must be set appropriately shorter, as otherwise this has an impact on the speed setpoint channel.

For bit 05 = 0:  
The integral component of the PID controller is held if a skip band or the minimum speed range is passed through in the speed set point channel.

This prevents the speed from oscillating between the edges of the skip band.

For bit 05 = 1:  
The setting is only effective if a skip band is no longer active.

The integral component of the PID controller is not held in the range of the skip speeds.

The skip band is passed through even for small system deviations and low controller gain factors. In so doing, the controller integral time must be selected large enough so that no undesirable speed oscillations occur between the skip band edges.

The influence of a minimum speed p1080 on the integration behavior can be reduced by raising the lower PID controller limit to p1080 / p2000 \* 100%.

For bit 06 = 1:

In r2349, bit 10 and bit 11 are not displayed when reaching internal limits (e.g. for OFF1/3).

<b>Description:</b>	Setting to invert the actual value signal of the technology controller. The inversion depends on the sensor type for the actual value signal.		
<b>Value:</b>	0: No inversion 1: Inversion actual value signal		
<b>Caution:</b>	If the actual value inversion is incorrectly selected, then the closed-loop control with the technology controller can become unstable and can oscillate!		
			
<b>Note:</b>	The correct setting can be determined as follows: - inhibit the technology controller (p2200 = 0). - increase the motor speed and in so doing, measure the actual value signal of the technology controller. --> If the actual value increases as the motor speed increases, then p2271 should be set to 0 (no inversion). --> If the actual value decreases as the motor speed increases, then p2271 should be set to 1 (the actual value signal is inverted).

## 2 Parameters

### 2.2 List of parameters

**Notice:** The following applies for p2251 = 0:  
If the output of the technology controller lies within the range of a suppression (skip) bandwidth (p1091 ... p1094, p1101) or below the minimum speed (p1080), the integral component of the controller is held so that the controller temporarily works as a P controller. This is necessary in order to prevent the controller from behaving in an unstable manner, as the ramp-function generator switches to the parameterized up and down ramps (p1120, p1121) at the same time in order to avoid setpoint steps. This state can be exited or avoided by changing the controller setpoint or by using the start speed (= minimum speed).

**Note:** When the controller output reaches the limit, the I component of the controller is held.  
p2285 = 0:  
The integral time is disabled and the I component of the controller is reset.

<b>Description:</b>	Sets the start value for the output of the technology controller. If the drive is switched on and the technology controller is already enabled (see p2200, r0056.3), then its output signal r2294 first goes to the start value p2302, before the controller starts to operate.		
<b>Dependency:</b>	The starting value is only effective in the mode "technology controller as main speed setpoint" (p2251 = 0). If the technology controller is first enabled when the drive is switched on, a start speed remains ineffective, and the controller output starts with the actual setpoint speed of the ramp-function generator.		

**Note:** If the technology controller operates on the speed/setpoint channel (p2251 = 0), then the starting value is interpreted as the starting speed and when operation is enabled, is connected to the output of the technology controller (r2294). If fault F07426 "technology controller actual value limited" occurs while ramping up to the starting value and if the associated reaction has been set to "NONE" (see p2100, p2101), the starting value is kept as the speed setpoint instead of a switch to closed-loop control operation.

**Description:** Setting to invert the system deviation of the technology controller. The setting depends on the type of control loop.

**Value:** 0: No inversion  
1: Inversion

**Caution:** If the actual value inversion is incorrectly selected, then the closed-loop control with the technology controller can become unstable and can oscillate!

**Note:** The correct setting can be determined as follows:

- inhibit the technology controller (p2200 = 0).
- increase the motor speed and in so doing, measure the actual value signal (of the technology controller).
- if the actual value increases with increasing motor speed, then the inversion should be switched out.
- if the actual value decreases with increasing motor speed, then the inversion should be set.

If value = 0:  
The drive reduces the output speed when the actual value rises (e.g. for heating fans, intake pump, compressor).

If value = 1:  
The drive increases the output speed when the actual value increases (e.g. for cooling fans, discharge pumps).

**Description:** Sets the threshold value for the system deviation of the technology controller, which controls holding the controller integral component in the range of the skip speeds of the ramp-function generator.

**Recommendation:** To avoid speed setpoint steps in the range of the skip speeds, we recommend setting p2252 bit 4 = 1 (ramp-function generator bypass de-activated).

**Dependency:** The parameter has no effect for p2252 bit 5 = 1 (integrator hold de-activated).  
Refer to: r2273

**Note:** Only p2251 = 0:  
If the output signal of the technology controller reaches a skip band in the speed setpoint channel, then the integral component of the controller is held, if at the same time, the system deviation is lower than the threshold value set here. By holding the integral component, it can be avoided that the controller oscillates in the range of the skip bands.

<b>Description:</b>	Sets the response of the technology controller to the occurrence of fault F07426 (technology controller actual value limited). The fault response is executed if status bit 8 or 9 in the technology controller status word r2349 is set. If both status bits are zero, a switch back to technology controller operation will follow.			
<b>Value:</b>	0: Function inhibited 1: On fault: Changeover to r2344 (or p2302) 2: On fault: Changeover to p2215			
<b>Dependency:</b>	The parameterized fault response is only effective if the technology controller mode is set to p2251 = 0 (technology controller as main setpoint). Refer to: p2267, p2268, r2344 Refer to: F07426			
<b>Notice:</b>	Dependent upon the application, the changing over of the setpoint when fault F07426 occurs can lead to the fault condition disappearing and the re-activation of the technology controller. This can repeat itself and cause limit oscillations. In this case, a different fault response or a different fixed setpoint 15 for the fault response p2345 = 2 should be selected.			
<b>Note:</b>	The parameterized fault response can only be achieved if the default fault response of the technology controller fault F07426 is set to "NONE" (see p2100, p2101). If a fault response other than "NONE" is entered in p2101 for F07426, p2345 must be set to zero. If the fault occurs during ramping up to the starting setpoint p2302, this starting setpoint is retained as the final value (there is no changeover to the fault response setpoint).

**Description:**

Setting to assign the encoder.

The actual value preprocessing and the closed-loop position control are carried out using the assigned encoder.

**Value:**

0: No encoder  
1: Encoder 1  
2: Encoder 2

**Dependency:**

Refer to: p0187, p0188

**Notice:**

For the setting p2502 = 0 (no encoder), closed-loop position control is not possible. This setting is only practical as supportive measure to implement encoderless closed-loop speed control (e.g. if the motor encoder is defective).

**Note:**

The assigned encoder (p2502 = 1, 2) must be allocated an encoder data set (p0187, p0188).

**Description:**

Sets the neutral length units LU per 10 mm.

Therefore, for a linear scale, a reference is established between the physical arrangement and the neutral length units LU used in the drive.

Example:

Linear scale, 10 mm should be broken down to units of  $\mu\text{m}$  (i.e. 1 LU = 1  $\mu\text{m}$ ).

--> p2503 = 10000

**Note:**

The assignment to the grid spacing can be achieved using this for a rotary axis with linear encoder.

<b>Description:</b>	Sets the neutral length units LU per load revolution. Therefore, for a rotary encoder, a reference is established between the physical arrangement and the neutral length units LU used in the drive. Example: Rotary encoder, ballscrew with 10 mm/revolution, 10 mm should be broken down to units of $\mu\text{m}$ (i.e. 1 LU = 1 $\mu\text{m}$ ). --> One load revolution corresponds to 10000 LU --> p2506 = 10000		
<b>Note:</b>	The position controller can only process position setpoints in the interpolator clock cycle (IPO clock cycle) in integer length units (LU, Length Unit). This is the reason that speed setpoints that are not a multiple integer of 1 LU per IPO clock cycle can only be realized as an average. The result speed setpoint steps are especially noticeable for a high loop gain or when the pre-control is active. Increasing p2506 counteracts this behavior.

<b>Description:</b>	Activating the adjustment and display of the status of the adjustment for absolute encoders.		
<b>Value:</b>	0: Error occurred while adjusting 1: Absolute encoder not adjusted 2: Absolute encoder not adjusted and encoder adjustment initiated 3: Absolute encoder adjusted		
<b>Dependency:</b>	Refer to: p2525, p2598, p2599, p2733		
<b>Caution:</b>	 For rotating absolute encoders, when adjusting, a range is set up symmetrically around zero with half of the encoder range, within which the position must be re-established after switch-off/switch-on. In this range, it is only permissible that the encoder overflows.  After the adjustment has been completed, it must be guaranteed that the range is not exited. The reason for this is that outside the range, there is no clear reference any longer between the encoder actual value and mechanical system.  If the reference point (CI: p2598) lies in this range, then the position actual value is set when adjusting to the reference point. Otherwise, adjustment is canceled with F07443.  There is no overflow for linear absolute encoders. This means that after the adjustment, the position can be re-established in the complete traversing range after switch-off/switch-on. When adjusting, the position actual value is set to the reference point.		
<b>Note:</b>	The encoder adjustment is initiated with p2507 = 2. The status is displayed using the other values.  In order to permanently save the determined position offset (p2525) and the DDS number (p2733), they must be saved in a non-volatile fashion (p0971, p0977).  This adjustment can only be initiated for an absolute encoder.

<b>Description:</b>	Sets the behavior of the position actual value preprocessing for the position controller for a DDS changeover. For p2519 = 1: In the following cases, for a DDS changeover, the actual position actual value becomes invalid and the reference point is reset: - the EDS effective for the closed-loop position control changes. - the encoder assignment changes (p2502). - the mechanical relationships change (p2503 ... p2506). - the direction of rotation changes (p1821). For absolute encoders, the status of the adjustment (p2507) is also reset if the same absolute encoder remains selected for the closed-loop position control, but the mechanical relationships or the direction of rotation have changed. In the operation state, in addition, a fault (F07494) is generated.		
<b>Notice:</b>	The remaining setting values are intended for expanded functionality.		
<b>Note:</b>	The behavior for a DDS changeover is determined using the value of p2519 in the target data set.

**Description:** Sets the proportional gain (P gain, position loop gain, Kv factor) of the position controller.

**Dependency:** Refer to: p2537, p2539, p2555, r2557, r2558

**Note:** The proportional gain is used define at which traversing velocity which following error is obtained (without pre-control)  
 Low proportional gain:  
 Slow response to a setpoint - actual value difference, the following error becomes large.  
 High proportional gain:  
 Fast response to the setpoint - actual value difference, the following error becomes small.

CU250S_V_PN (Position control)	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	- [LU]	- [LU]	- [LU]
<b>Description:</b>	Display and connector output for the dynamic following error. This value is the deviation, corrected by the velocity-dependent component, between the position setpoint and the position actual value.		
<b>Note:</b>	For p2534 >= 100 % (pre-control activated) the following applies: The dynamic following error (r2563) corresponds to the system deviation (r2557) at the position controller input. For 0 % < p2534 < 100 % (pre-control activated) or p2534 = 0 % (pre-control de-activated) the following applies: The dynamic following error (r2563) is the deviation between the measured position actual value and a value that is calculated from the position setpoint via a PT1 model. This compensates the system-related velocity-dependent system deviation for a P controller.

CU250S_V_PN (Position control)	<b>Min</b> - [LU]	<b>Max</b> - [LU]	<b>Factory setting</b> - [LU]
<b>Description:</b>	Display and connector output for the actual following error. This value is the deviation between the position setpoint - after fine interpolation - and the position actual value.		
<b>Notice:</b>	When speed pre-control is active (p2534 > 0 %), the following applies: To calculate this value, the position setpoint is delayed by two position controller clock cycles. When speed pre-control is inactive (p2534 = 0 %), the following applies: To calculate this value, the position setpoint is delayed by two position controller clock cycles.

<b>Description:</b>	Sets the moment of inertia for the torque pre-control.		
<b>Dependency:</b>	Refer to: p2534, r2564		
<b>Note:</b>	When calculating the torque pre-control value (r2654), the time derivation of the speed pre-control value is multiplied by 2 PI * p2567. For reasons associated with the compatibility to earlier firmware versions, the factory setting for p2567 = 1 kgm <sup>2</sup> /2 PI. This means that CO: r2564 remains as standard the derivation over time of the speed pre-control value and is referred, as before, to a moment of inertia of 1 kgm <sup>2</sup> /2 PI. For torque pre-control, the moment of inertia can now be directly entered into p2567 (instead of subsequently evaluating the pre-control value).

<b>Description:</b>	Sets the jerk limiting		
<b>Dependency:</b>	Refer to: p2572, p2573, p2575		
<b>Note:</b>	The jerk limiting is internally converted into a jerk time as follows: Jerk time $T_r = \max(p2572, p2573) / p2574$ The jerk time is internally limited to 1000 ms and is rounded-off to an integer multiple of the sampling time positioning (VECTOR: 8000). The jerk time is valid for the acceleration and deceleration phases also for unequal maximum acceleration (p2572) and maximum deceleration (p2573). For unequal maximum acceleration and maximum deceleration, the motion is not optimal from a time perspective as the jerk limit cannot be used for the lower of the two values. If, in the traversing profile, the acceleration time without jerk limiting is less than the jerk time $T_r$ , then the motion with jerk limiting is not optimum from a time perspective. For traversing motion with a direct transition between acceleration and deceleration (i.e. jerk time is greater than the constant velocity phase), jerk can increase up to twice the parameterized jerk. CONTINUE_FLYING with direction reversal acts internally just like a CONTINUE_WITH_STOP without the "position reached" being set. Without jerk limiting, this behavior can hardly be noticed as, when reversing, the position setpoint is only kept at zero for one interpolator clock cycle. For block change enable CONTINUE_WITH_STOP, jerk limiting results in a longer delay time.

**Description:** Sets the signal source to activate the "software limit switch".

**Dependency:** Refer to: p2578, p2579, p2580, p2581

**Caution:** Software limit switch effective:  
 - axis is referenced (r2684.11 = 1) and BI: p2582 = 1 signal.  
 Software limit switch ineffective:  
 - modulo correction active (BI: p2577 = 1 signal).  
 - search for reference is executed.

**Notice:** Target position for relative positioning outside software limit switch:  
 The traversing block is started and the axis comes to a standstill at the software limit switch. An appropriate alarm is output and the traversing block is interrupted. Traversing blocks with valid position can be activated.  
 Target position for absolute positioning outside software limit switch:  
 In the "traversing blocks" mode, the traversing block is not started and an appropriate fault is output.  
 Axis outside the valid traversing range:  
 If the axis is already outside the valid traversing range, then an appropriate fault is output. The fault can be acknowledged at standstill. Traversing blocks with valid position can be activated.

**Note:** The traversing range can also be limited using STOP cams.

CU250S_V_PN (EPOS)	<b>Min</b> -200000 [LU]	<b>Max</b> 200000 [LU]	<b>Factory setting</b> 0 [LU]
<b>Description:</b>	Sets the amount of play (backlash) for positive or negative play.		

0: The backlash compensation is de-activated.

> 0: Positive backlash (normal case)

When the direction is reversed, the encoder actual value leads the actual value.

< 0: Negative backlash

When the direction is reversed, the actual value leads the encoder actual value.

**Dependency:**

If a stationary axis is referenced by setting the reference point, or an adjusted with absolute encoder is switched on, then the setting of p2604 is relevant for entering the compensation value.

p2604 = 1:

Traveling in the positive direction -> A compensation value is immediately entered.

Traveling in the negative direction -> A compensation value is not entered

p2604 = 0:

Traveling in the positive direction -> A compensation value is not entered

Traveling in the negative direction -> A compensation value is immediately entered.

When again setting the reference point (a referenced axis) or for "flying referencing", p2604 is not relevant but instead the history of the axis.

CU250S_V_PN (EPOS)	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	2524[0]

**Description:** Sets the signal source for the reference of the internal length units LU to motor revolution for rotary encoders and to mm for linear encoders.

**Dependency:** Refer to: p0404, r2524, p2594

**Note:** The signal value is used to convert the length unit to the speed or velocity setpoint.

**p2594[0...2]****CI: EPOS Maximum velocity externally limited / v\_Max ext lim**

**Description:** Sets the signal source for the externally limited maximum velocity.

**Index:**  
 [0] = Setpoint limit absolute  
 [1] = Setpoint limiting positive  
 [2] = Setpoint limiting negative

**Dependency:** Refer to: r2524, p2571, p2593

**Warning:** In order that the externally limited velocity can be effective for the EPOS operating modes, connector input p2593 must be correctly interconnected.

CU250S_V_PN (EPOS)	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0

**Description:** Sets the signal source to start the "search for reference" or "flying referencing".

BI: p2595 = 0/1 signal

Referencing is started.

BI: p2595 = 1/0 signal

Referencing is interrupted.

**Dependency:** Refer to: p2597, p2598, p2599, r2684

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** Search for reference (BI: p2597 = 0 signal):

The reference point approach can only be activated (0/1 edge) after traversing motion that is being processed has been completed.

With the start, where relevant, the state signal "reference point set" (r2684.11) is reset.

Flying referencing (BI: p2597 = 1 signal):

With the start, the state signal "reference point set" (r2684.11) is not reset.

**Description:** Sets the signal source for the "set reference point".

**Dependency:** Refer to: p2598, p2599, r2684

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** Reference point setting is effective in the following operating states:

- in the basic state.
- for FIXED STOP with progress condition END (corresponds to the initial state).
- for traversing block interrupted via BI: p2640 = 0 signal (intermediate stop).
- for EPOS not enabled (BI: p2656 = 0 signal) and position actual value valid (BI: p2658 = 1 signal).

**Description:** Sets the signal source for the reference point coordinate.  
This value is used as reference for the following referencing operations:

- search for reference
- set reference point
- flying referencing
- absolute value adjustment

**Index:** [0] = Position control  
[1] = Encoder 1  
[2] = Encoder 2  
[3] = Reserved

**Dependency:** Refer to: p2502, p2507, p2595, p2596, p2597, p2599

**Note:** Incremental measuring system:

After the reference point is reached, the drive accepts the actual axis position from the position received via the connector input p2598[0].

Absolute encoder:

When adjusting the encoder, the position received via the connector input is set as the actual axis position. The position offset to the actual encoder value is displayed in p2525.

**Description:** Sets whether or not a reference cam is present for the search for reference.  
Value = 1: Reference cam present.  
Value = 0: No reference cam present.

**Dependency:** Refer to: p2595, p2597, p2604, p2605, p2606

<b>p2608 EPOS search for reference approach velocity zero mark / v_appr ref_ZM</b>			
CU250S_V (EPOS)	<b>Access level:</b> 1	<b>Calculated:</b> -	<b>Data type:</b> Unsigned32
CU250S_V_CAN (EPOS)	<b>Can be changed:</b> U, T	<b>Scaling:</b> -	<b>Dyn. index:</b> -
CU250S_V_DP (EPOS)	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 3612

**Description:** Sets the approach velocity after detecting the reference cam to search for the zero mark for the search for reference.  
**Dependency:** If there is no reference cam (p2607 = 0), the search for reference immediately starts with the axis traversing to the zero mark.

Refer to: p2595, p2597, p2604, p2607, p2609, p2610

**Caution:**

If the reference cam is not adjusted so that at each search for reference the same zero mark for synchronization is detected, then an "incorrect" axis reference point is obtained.

After the reference cam has been left, the search for the zero mark is activated with a time delay due to internal factors. This is the reason that the reference cam should be adjusted in this center between two zero marks and the approach velocity should be adapted to the distance between two zero marks.

**Note:** The velocity override is not effective when traversing to the zero mark.

CU250S_V_PN (EPOS)	<b>Min</b> 0 [LU]	<b>Max</b> 2147482647 [LU]	<b>Factory setting</b> 2147482647 [LU]

**Description:** Sets the tolerance bandwidth for the distance to the zero mark  
The zero mark is evaluated within the maximum distance between the reference cam and zero mark (p2609) minus the tolerance bandwidth for the distance to the zero mark (p2610).

**Dependency:** Refer to: p2609

**Description:** Sets the signal source for the reversing cam in the negative direction of travel.

1 signal: Reversing cam not reached.

0 signal: Reversing cam reached.

**Dependency:** Refer to: p2614

**Note:** If, during the search for reference from the reversing cam minus and plus, a 0 signal is detected, then the axis remains stationary (at standstill).

CU250S_V_PN (EPOS)	<b>Min</b> -2147483648	<b>Max</b> 2147483647	<b>Factory setting</b> 0

**Description:** Sets additional information/data of the appropriate task for the traversing block.

**Dependency:** The number of indices depends on p2615.  
Refer to: p2615, p2616, p2617, p2618, p2619, p2620, p2621, p2623, p2624

**Note:** The following should be set depending on the task:  
FIXED STOP: Clamping torque and clamping force (rotary 0...65536 [0.01 Nm], linear 0...65536 [N])  
WAIT: Delay time [ms]  
GOTO: Block number  
SET\_O: 1, 2 or 3 - set direct output 1, 2 or 3 (both)  
RESET\_O: 1, 2 or 3 - reset direct output 1, 2 or 3 (both)  
JERK: 0 - de-activate, 1 - activate

<b>p2623[0...n]</b>	<b>EPOS traversing block task mode / Trav_block mode</b>

CU250S_V_PN (EPOS)	<b>Min</b> 0	<b>Max</b> 65535	<b>Factory setting</b> 0

**Description:** Sets the influence of the task for the traversing block.  
Value = 0000 cccc bbbb aaaa  
cccc: Positioning mode  
cccc = 0000 --> ABSOLUTE  
cccc = 0001 --> RELATIVE  
cccc = 0010 --> ABS\_POS (only for a rotary axis with modulo correction)  
cccc = 0011 --> ABS\_NEG (only for a rotary axis with modulo correction)  
bbbb: Progression condition  
bbbb = 0000 --> END  
bbbb = 0001 --> CONTINUE WITH STOP  
bbbb = 0010 --> CONTINUE FLYING  
bbbb = 0011 --> CONTINUE EXTERNAL  
bbbb = 0100 --> CONTINUE EXTERNAL WAIT  
bbbb = 0101 --> CONTINUE EXTERNAL ALARM  
aaaa: IDs  
aaaa = 000x --> show/hide block (x = 0: show, x = 1: hide)

**Dependency:** The number of indices depends on p2615.  
Refer to: p2615, p2616, p2617, p2618, p2619, p2620, p2621, p2622, p2624

<b>p2624</b>	<b>EPOS traversing block sorting / Trav_block sort</b>		
CU250S_V (EPOS)	<b>Access level:</b> 1	<b>Calculated:</b> -	<b>Data type:</b> Unsigned16
CU250S_V_CAN (EPOS)	<b>Can be changed:</b> U, T	<b>Scaling:</b> -	<b>Dyn. index:</b> -

CU250S_V_PN (EPOS)	<b>Min</b> 0	<b>Max</b> 1	<b>Factory setting</b> 0

**Description:** Sets the traversing blocks for sorting corresponding to their block number.

Procedure: Set p2624 = 0 --> 1.

Sorting is started and the parameters are automatically reset to zero once the operation has been completed.

**Dependency:**

Refer to: p2615, p2616, p2617, p2618, p2619, p2620, p2621, p2622, p2623

**Note:**

After sorting, the traversing blocks are written at the beginning of the memory in increasing sequence without any gaps.

## 2 Parameters

### 2.2 List of parameters

---

<b>p2631</b>	<b>BI: EPOS activate traversing task (0 -&gt; 1) / Trav_task act</b>		
CU250S_V (EPOS)	<b>Access level:</b> 1	<b>Calculated:</b> -	<b>Data type:</b> U32 / Binary
CU250S_V_CAN (EPOS)	<b>Can be changed:</b> T	<b>Scaling:</b> -	<b>Dyn. index:</b> -
CU250S_V_DP (EPOS)	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 3616, 3625
CU250S_V_PN (EPOS)	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0

**Description:** Sets the signal source for "activating traversing task".  
BI: p2631 = 0/1 signal  
The traversing task, selected using BI: p2625 ... p2630, is started.

**Dependency:** Refer to: p2625, p2626, p2627, p2628, p2640, p2641

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** To start a traversing block, the axis must be referenced (r2684.11 = 1).  
The status signal r2684.12 = 0/1 signal is used for acknowledgment.  
A traversing task can be influenced using the following signals:  
- intermediate stop via BI: p2640.  
- reject traversing task via BI: p2641.

---

<b>p2632</b>	<b>EPOS external block change evaluation / Ext BlckChg eval</b>		
CU250S_V (EPOS)	<b>Access level:</b> 1	<b>Calculated:</b> -	<b>Data type:</b> Integer16
CU250S_V_CAN (EPOS)	<b>Can be changed:</b> T	<b>Scaling:</b> -	<b>Dyn. index:</b> -
CU250S_V_DP (EPOS)	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 3615, 3616
CU250S_V_PN (EPOS)	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	1	0

**Description:** Sets the mode to evaluate "external block change".

**Value:** 0: External block change via the measuring probe  
1: External block change via BI: p2633

**Dependency:** Refer to: p2623, p2633, r2677, r2678

**Note:** In the mode "external block change via measuring probe (p2632 = 0), the following applies:  
When starting a traversing block with the block change enable CONTINUE\_EXTERNAL, CONTINUE\_EXTERNAL\_WAIT and CONTINUE\_EXTERNAL\_ALARM an activated "flying referencing" is interrupted. After ending the block, "flying referencing" must be re-activated via BI: p2595 = 0/1 signal.

---

<b>p2633</b>	<b>BI: EPOS external block change (0 -&gt; 1) / Ext BlckChg (0-&gt;1)</b>		
CU250S_V (EPOS)	<b>Access level:</b> 1	<b>Calculated:</b> -	<b>Data type:</b> U32 / Binary
CU250S_V_CAN (EPOS)	<b>Can be changed:</b> T	<b>Scaling:</b> -	<b>Dyn. index:</b> -
CU250S_V_DP (EPOS)	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 3615
CU250S_V_PN (EPOS)	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0

**Description:** Sets the signal source for "external block change".  
BI: p2633 = 0/1 signal

**Dependency:** The evaluation of the signal is only active p2632 = 1.  
Refer to: p2623, p2632, p2640, p2641, r2677, r2678

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** A 0/1 edge initiates a flying block change in the subsequent traversing block.  
When the external block change is identified, the actual position is saved in r2678.  
A traversing task can be influenced using the following signals:  
- intermediate stop via BI: p2640.  
- reject traversing task via BI: p2641.

<b>p2634[0...n]</b>	<b>EPOS fixed stop maximum following error / Following err max</b>

CU250S_V_PN (Position control)	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0 [LU]	2147482647 [LU]	1000 [LU]
<b>Description:</b>	Sets the following error to detect the "fixed stop reached" state (r2526.4).		
<b>Dependency:</b>	Refer to: r2526, p2621, r2675		
<b>Note:</b>	The state "fixed stop reached" is detected if the following error exceeds the theoretically calculated following error value by p2634.		
<b>p2635</b>	<b>EPOS fixed stop monitoring window / Fixed stop monit</b>		
CU250S_V (Position control)	<b>Access level:</b> 1	<b>Calculated:</b> -	<b>Data type:</b> Unsigned32

CU250S_V_PN (Position control)	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0 [LU]	2147482647 [LU]	100 [LU]
<b>Description:</b>	Sets the monitoring window of the actual position after the fixed stop is reached.		
<b>Dependency:</b>	Refer to: r2526, r2683 Refer to: F07484		
<b>Note:</b>	If, after the fixed stop is reached, the end stop shifts in either the positive or negative direction by more than the value set here, then BO: r2526.5 is set to 1 and an appropriate message is output.		
<b>p2637</b>	<b>BI: EPOS fixed stop reached / Fixed stop reached</b>

CU250S_V_PN (EPOS)	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	2526.4
<b>Description:</b>	Sets the signal source for the feedback signal "fixed stop reached". BI: p2637 = 1 signal Fixed stop is reached. BI: p2637 = 0 signal Fixed stop is not reached.		
<b>Dependency:</b>	Refer to: r2526, p2634		
<b>Notice:</b>	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
<b>Note:</b>	The identification of "fixed stop reached" is, for the factory setting, dependent on the signal BO: r2526.4 (fixed stop reached). This signal is influenced via p2634 (EPOS fixed stop, maximum following error).		
<b>p2638</b>	<b>BI: EPOS fixed stop outside the monitoring window / Fixed stop outside</b>

CU250S_V_PN (EPOS)	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	2526.5
<b>Description:</b>	Sets the signal source for the feedback signal "fixed stop outside the monitoring window".		

## 2 Parameters

### 2.2 List of parameters

BI: p2638 = 1 signal  
Fixed stop is located outside the monitoring window.  
BI: p2638 = 0 signal  
Fixed stop is inside the monitoring window.

**Dependency:**

Refer to: r2526, p2635

**Note:**

The identification of "fixed stop outside the monitoring window" is, for the factory setting, dependent on signal BO: r2526.5 (fixed stop outside window). This signal is influenced via p2635 (EPOS fixed stop monitoring window).

#### p2639

#### BI: EPOS torque limit reached / M\_limit reached

CU250S_V (EPOS)	<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> U32 / Binary

CU250S_V_PN (EPOS)	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	1407.7

**Description:**

Sets the signal source for the feedback signal "torque limit reached" when traversing to fixed stop.  
BI: p2639 = 1 signal  
Torque limit is reached.  
BI: p2639 = 0 signal  
Torque limit is not reached.

**Dependency:**

Refer to: r1407

**Note:**

The feedback signal from "torque limit reached" is, for the factory setting, dependent on the signal BO: r1407.7 (torque limit reached).

**Description:**

Sets the signal source for the "no intermediate stop/intermediate stop".  
BI: p2640 = 1 signal  
No intermediate stop.  
BI: p2640 = 0 signal  
Intermediate stop.

**Dependency:**

Refer to: p2631, p2641, p2647, p2649

**Caution:**

For BI: p2649 = 1 signal, the following applies:  
Motion starts without any explicit control signal.

**Notice:**

The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:**

This signal is only effective in the modes "traversing blocks" and "direct setpoint input/MDI".  
When activating the intermediate stop, the axis brakes with the parameterized deceleration (p2620 or p2645).

<b>Description:</b>	Sets the signal source for the deceleration override in the operating mode "direct setpoint input/MDI".		
<b>Dependency:</b>	Refer to: p2649, p2650, p2693		
<b>Notice:</b>	If, when calculating the traversing profile, it is identified that the target position with the programmed deceleration override cannot be reached without reversing the direction, then when accepting the dynamic values, the larger deceleration override is accepted and becomes effective. The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
<b>Note:</b>	Depending on p2649, the deceleration override is either transferred continuously or edge-triggered. The signal value 4000 hex (16384 dec) corresponds to 100 %.

## 2 Parameters

### 2.2 List of parameters

**Note:** The status signal r2684.12 = 0/1 signal is used for acknowledgment.  
The operating mode "direct setpoint input/MDI" can be influenced via the following signals:  
- intermediate stop via BI: p2640.  
- reject traversing task via BI: p2641.

**Description:** Sets the signal source for the positive direction selection in the operating mode "direct setpoint input/MDI".

**Dependency:** Refer to: p2576, p2648, p2649, p2650, p2652, p2653, p2654

**Note:** The following applies for "setting-up":

- the traversing direction can be entered using this binector input.
- if both directions (p2651, p2652) are selected, then the axis remains stationary (zero speed).
- if both directions (p2651, p2652) are de-selected, then the axis remains stationary (zero speed).

The following applies for "positioning":

Using binector inputs p2651 and p2652, when the modulo correction (BI: p2577 = 1 signal) is activated and for absolute positioning (BI: p2648 = 1 signal), the traversing direction is specified as follows:

BI: p2651 / BI: p2652

0 signal / 0 signal: Absolute positioning through the shortest distance.

1 signal / 0 signal: Absolute positioning in the positive direction.

0 signal / 1 signal: Absolute positioning in the negative direction.

1 signal / 1 signal: Absolute positioning through the shortest distance.

	13	STOP cam minus active	Yes	No	3630
	14	STOP cam plus active	Yes	No	3630
	15	Traversing command active	Yes	No	3635

**Note:** For bit 02:  
The "referencing active" signal is an OR logic operation of "search for reference active" and "flying referencing active".  
For bit 00 ... 07 and 11 ... 14:  
These signals are generated in the function module "basic positioner".  
For bit 08:  
The signal is generated in the "closed-loop position control" function module.

<b>Description:</b>	Sets the number of rotations that can be resolved for a rotary absolute encoder with activated position tracking of the load gear.		
<b>Dependency:</b>	This parameter is only of significance for an absolute encoder (p0404.1 = 1) with activated position tracking of the load gear (p2720.0 = 1).		

## 2 Parameters

### 2.2 List of parameters

**Note:** The resolution that is set must be able to be represented using r2723.  
For rotary axes/modulo axes, the following applies:  
This parameter is pre-set with p0421 when activating position tracking and can be changed.  
For linear axes, the following applies:  
This parameter is pre-assigned with p0421 when activating position tracking, expanded by 6 bits for multiturn information (maximum number of overflows) and cannot be changed.

<b>p2722[0...n]</b>	<b>Load gear position tracking tolerance window / Pos track tol</b>		
<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> FloatingPoint32	
<b>Can be changed:</b> C(1)	<b>Scaling:</b> -	<b>Dyn. index:</b> DDS, p0180	
<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -	
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
0.00	4294967300.00	0.00	

**Description:** Sets a tolerance window for position tracking.  
After the system is switched on, the difference between the saved position and the actual position is determined, and depending on this, the following is initiated:  
Difference within the tolerance window --> The position is reproduced as a result of the encoder actual value.  
Difference outside the tolerance window --> An appropriate message is output.

**Caution:** Rotation, e.g. through a complete encoder range is not detected.

  
**Note:** The value is entered in integer (complete) encoder pulses.  
For p2720.0 = 1, the value is automatically pre-assigned quarter of the encoder range.  
Example:  
Quarter of the encoder range = (p0408 \* p0421) / 4  
It is possible that the tolerance window may not be able to be precisely set due to the data type (floating point number with 23 bit mantissa).

**Description:** Displays the position difference before the load gear between switching off and switching on.

**Note:** The increments are displayed in the same format as for r0483/r2723.  
If the measuring gear of the motor encoder is not activated, the position difference should be read in encoder increments.  
If the measuring gear of the motor encoder is activated, the position difference is converted using the measuring gear factor.

**Note:** For bit 00:  
Hardware or software malfunction was identified. Carry out a POWER ON of the component involved. If it occurs again, contact Technical Support.  
For bit 01:  
A line supply fault has occurred (phase failure, voltage level, ...). Check the line supply / fuses. Check the supply voltage. Check the wiring.  
For bit 02:  
The DC link voltage has assumed an inadmissibly high value. Check the dimensioning of the system (line supply, reactor, voltages). Check the infeed settings.  
For bit 03:  
An inadmissible operating state of the power electronics was identified (overcurrent, overtemperature, IGBT failure, ...). Check that the permissible load cycles are maintained. Check the ambient temperatures (fan).  
For bit 04:  
The temperature in the component has exceeded the highest permissible limit. Check the ambient temperature / control cabinet cooling.

For bit 05:

A ground fault / inter-phase short-circuit was detected in the power cables or in the motor windings. Check the power cable (connection). Check the motor.

For bit 06:

The motor was operated outside the permissible limits (temperature, current, torque, ...). Check the load cycles and limits that have been set. Check the ambient temperature / motor cooling.

For bit 07:

The communication to the higher-level control system (internal coupling, PROFIBUS, PROFINET, ...) is faulted or interrupted. Check the state of the higher-level control system. Check the communication connection/wiring. Check the bus configuration / clock cycles.

For bit 08:

A safety operation monitoring function (Safety) has detected an error.

For bit 09:

When evaluating the encoder signals (track signals, zero marks, absolute values, ...) an illegal signal state was detected. Check the encoder / state of the encoder signals. Observe the maximum frequencies.

For bit 10:

The internal communication between the SINAMICS components is faulted or interrupted. Check the DRIVE-CLiQ wiring. Ensure an EMC-compliant design. Observe the maximum permissible quantity structure / clock cycles.

For bit 11:

The infeed is faulted or has failed. Check the infeed and the surroundings (line supply, filter, reactors, fuses, ...). Check the closed-loop infeed control.

For bit 15:

Group fault. Determine the precise cause of the fault using the commissioning tool.

## 2 Parameters

### 2.2 List of parameters

This parameter specifies the speed (n) of point 1 as a [%].

The characteristic comprises the following value pairs:

Power (P) / speed (n)

p3320 / p3321 --> point 1 (P1 / n1)

p3322 / p3323 --> point 2 (P2 / n2)

p3324 / p3325 --> point 3 (P3 / n3)

p3326 / p3327 --> point 4 (P4 / n4)

p3328 / p3329 --> point 5 (P5 / n5)

**Dependency:**

Refer to: r0041, p3320, p3322, p3323, p3324, p3325, p3326, p3327, p3328, p3329

**Note:**

The reference value for power and speed is the rated power/rated speed.

The energy saved is displayed in r0041.

<b>Description:</b>	Selects the upper changeover point of the friction characteristic for the frictional torque input controlled by the motor model of the induction motor. The speed of this changeover point is pre-assigned when automatically calculating with the changeover speed p1752. The changeover point located below is pre-assigned with the changeover speed $p1752 * (1 - p1753)$ . Example: p3844 = 3 means that the speed value for the change to the monitor model (p3823 = p1752) is entered into p3823 (friction characteristic value n3). Depending on the display of r3840.9, the frictional torque is calculated from the friction characteristic values, which are associated with these changeover points. For the changeover of the motor model, with hysteresis, the frictional torque smoothed with p3843 changes between these two states.		
<b>Dependency:</b>	As part of the automatic calculation (p0340), p3844 is only activated for closed loop control (p1300 = 21, 23) of induction motors with encoder. Refer to: p3843		
<b>Notice:</b>	If the changeover point defined using p3844 does not match the changeover speed p1752, then internally, the model-controlled friction torque input is automatically de-activated (same as for p3844 = 0).		
<b>Note:</b>	For p3844 = 0, the model-controlled frictional torque changeover is de-activated. The frictional torque is then calculated the same as for the encoderless control by interpolating between the points along the friction characteristic.

<b>Description:</b>	Setting for the friction characteristic record. After the next switch-on command, the friction characteristic is automatically recorded.		
<b>Value:</b>	0: Friction characteristic record de-activated 1: Friction char record activated for all directions 2: Friction char record activated for positive direction 3: Friction char record activated for negative direction		
<b>Dependency:</b>	When selecting the friction characteristic measurement, the drive data set changeover is suppressed. For linear drives (refer to r0108 bit 12) it is not permissible to carry out the friction characteristic measurement for mechanical systems that limit travel.		
<b>Danger:</b>	For drives with a mechanical system that limit the distance moved, it must be ensured that during recording, the friction characteristic is not reached. If this is not the case, then it is not permissible that the measurement is carried out.		
			
<b>Notice:</b>	To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).		

**Note:** When the friction characteristic record is active, it is not possible to save the parameters (p0971, p0977).  
 When the friction characteristic record is active (p3845 > 0), it is not possible to change p3820 ... p3829, p3830 ... p3839 and p3842.  
 When recording the friction characteristic, in addition to the friction, the motor losses are also determined (e.g. iron losses, eddy current losses and re-magnetizing losses). A differentiation is not made between these individual loss components. We recommend that a motor temperature sensor is used because torque deviations can also be emulated/mapped on the characteristic due to the thermal influence.

<b>Description:</b>	Compound braking current is used to define the amount of DC current that is produced on stopping the motor during U/f operation to further increase the DC brake function. Compound braking is a superimposition of the DC brake function with regenerative braking (net braking along the ramp) after OFF1 or OFF3. This permits braking with controlled motor frequency and minimum power input into the motor. Effective braking without using additional hardware components is obtained by optimizing the ramp down time and compound braking.		
<b>Dependency:</b>	The compound braking current is only activated if the DC link voltage exceeds the threshold value in r1282. Compound braking does not operate in the following cases: <ul style="list-style-type: none"> <li>- DC braking activated (p1230, r1239).</li> <li>- motor is still not magnetized (e.g. for flying restart).</li> <li>- vector control parameterized (p1300 &gt;= 20).</li> <li>- synchronous motor used (p0300 = 2xx).</li> </ul>		
<b>Notice:</b>	Generally, increasing the braking current improves the braking effect when stopping the motor. However, if the value is set too high, then the drive can be tripped (shut down) as a result of overcurrent or ground fault. Recommendation: $p3856 < 100 \% \times (r0209 - r0331) / p0305 / 2$ Compound braking generates a current in the motor with a ripple manifesting the rotational frequency. The higher the braking current is set, the higher the resulting ripple, especially when the Vdc_max control is simultaneously active (refer to p1280).		

## 2 Parameters

### 2.2 List of parameters

**Note:** The parameter value is entered relative to the rated motor current (p0305).  
Compound braking is de-activated with p3856 = 0%.

**Description:** Sets the configuration when operating a long stator motor.

<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	00	Activate long stator help functions	Active	Inactive	-
	01	Suppress Gx_ZSW.14	Active	Inactive	-

**Notice:** The following restrictions apply to this function:  
- it is not permissible to change over the drive data set.  
- the encoder/drive may not be parked using a PROFIBUS telegram.  
- a maximum of 4 drives may be connected to the Control Unit.  
- it is not permissible to commutate with the zero mark (p0404).

**Note:** For bit 00:  
All of the help functions for long stator motors can be enabled/disabled using this bit.  
For bit 01:  
When the bit is set, bit 14 (parking encoder active) is set to 0 in the encoder status word GX\_ZSW independent of whether the encoder is parked or not.

#### p3900 Completion of quick commissioning / Compl quick\_comm

**Access level:** 1                      **Calculated:** -                      **Data type:** Integer16  
**Can be changed:** C(1)                      **Scaling:** -                      **Dyn. index:** -  
**Unit group:** -                      **Unit selection:** -                      **Func. diagram:** -  
**Min**                      **Max**                      **Factory setting**  
0                      3                      0

**Description:** Exits quick commissioning (p0010 = 1) with automatic calculation of all parameters of all existing drive data sets that depend on the entries made during quick commissioning.  
p3900 = 1 initially includes a parameter reset (factory setting, the same as p0970 = 1) for all parameters of the drive object; however, without overwriting the entries made during the quick commissioning.  
The interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p15 and p1500 are re-established and all of the dependent motor, open-loop and control-loop control parameters are calculated (corresponding to p0340 = 1).  
p3900 = 2 includes the restoration of the interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p15 and p1500 and the calculations corresponding to p0340 = 1.  
p3900 = 3 only includes the calculations associated with the motor, open-loop and closed-loop control parameters corresponding to p0340 = 1.

<b>Value:</b>	0: No quick parameterization 1: Quick parameterization after parameter reset 2: Quick parameterization (only) for BICO and motor parameters 3: Quick parameterization for motor parameters (only)
<b>Notice:</b>	After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.
<b>Note:</b>	When the calculations have been completed, p3900 and p0010 are automatically reset to a value of zero. When calculating motor, open-loop and closed-loop control parameters (such as for p0340 = 1) parameters associated with a selected Siemens catalog motor are not overwritten. If a catalog motor has not been selected (p0300), then the following parameters are reset with p3900 > 0 in order to restore the situation that applied when commissioning the drive for the first time: induction motor: p0320, p0352, p0362 ... p0369, p0604, p0605, p0626 ... p0628 synchronous motor: p0326, p0327, p0352, p0604, p0605

	-	-	0000 0000 0000 0000 0000 0000 0000 0000 bin

**Description:** Sets the configuration for evaluation on the analog sensor.

<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	06	Set velocity to 0	Yes	No	-
	08	Pos val range	0.0 / 1.0 pulse	-0.5 / +0.5 pulse	-
	09	Fault/alarm messages	Alarm	Fault	-
	10	Channel B act	Yes	No	-
	11	Channel A act	Yes	No	-
	13	Commutation angle constant	Yes	No	-
	14	Suppress faults	Yes	No	-
	31	Extrapolation	ON	OFF	-

**Notice:** For bit 06:  
Setting the bit sets the velocity actual value (r0061) permanently to 0.

For bit 13:

Setting the bit sets the commutation angle permanently to the commutation angle offset (p0431).

**Note:** For bit 09:

A setting of bit = 0 will trigger a fault for the relevant channel if the actual value is invalid.

A setting of bit = 1 will trigger an alarm for the relevant channel if the actual value is invalid.

For bit 10, 11:

If both channels are activated, the actual value is generated from the mean value of both channels. If a channel fails (actual value invalid), it is not included when the mean value is generated.

For bit 14:

The bit is only evaluated for encoder 1. Otherwise no effect.

2:	Single-ended A*, B*
3:	Single-ended A, B sensitive

**Note:** p4671 = 0:  
The two signals on a track are evaluated differentially.

p4671 = 1:  
Only the non-inverted signal on a track is evaluated.

p4671 = 2:  
Only the inverted signal on a track is evaluated.

p4671 = 3:  
Only the non-inverted signal on a track (high resolution) is evaluated.

**Description:** Sets the positive tolerance window in encoder pulses for limit 1 for the zero mark monitoring. If the deviation is less than this limit, then the pulse number is not corrected. If it is higher than this limit, fault F3x131 is triggered.

If fault F3x131 is re-parameterized to alarm (A) or no message (N), the encoder pulses which have not been corrected are added to the accumulator (p4688). The accumulator can be de-activated using p0437.7.

**Dependency:** Refer to: p0437, p4688  
Refer to: F31131

## 2 Parameters

### 2.2 List of parameters

**Note:** This monitoring is activated by setting p0437.2 = 1 (position actual value correction).  
The positive limit describes additional pulses due to EMC.

**Description:** Sets the negative tolerance window in encoder pulses for limit 1 for the zero mark monitoring.  
If the deviation is less than this limit, the PPR is not corrected. If it is higher than this limit, fault F3x131 is triggered.  
If fault F3x131 is re-parameterized to alarm (A) or no message (N), the encoder pulses which have not been corrected are added to the accumulator (p4688). The accumulator can be de-activated using p0437.7.

**Dependency:** Refer to: p0437, p4681, p4688  
Refer to: F31131

**Note:** This monitoring is activated by setting p0437.2 = 1 (position actual value correction).  
For a set value = -1001, the negated value of p4681 is effective.  
The negative limit describes the pulses lost due to a covered glass panel in the incremental encoder.

**Note:** For bit 00:  
 For significant differences between the motor and load moment of inertia, or for low dynamic performance of the controller, then the P controller becomes a PD controller in the position control loop. As a consequence, the dynamic performance of the position controller is increased.  
 This function should only be set when the speed pre-control (bit 3 = 1) or the torque pre-control (bit 4 = 1) is active.

For bit 01:  
 At low speeds, the controller gain factors are automatically reduced in order to avoid noise and oscillation at standstill.

For bit 02:  
 The estimated load moment of inertia is taken into account for the speed controller gain (see p5273).

For bit 03:  
 Activates the speed pre-control for the basic positioner (EPOS).

For bit 04:  
 Activates the torque pre-control for the basic positioner (EPOS).

For bit 05:  
 The maximum setpoint acceleration for the basic positioner (EPOS) is determined based on the estimated moment of inertia. This is realized by activating the bit once.  
 The prerequisite is that the drive pulses are inhibited, and the moment of inertia was previously determined.

For bit 06:  
 The speed controller gain set in p1460 is not changed when calculating the controller data.

## 2 Parameters

### 2.2 List of parameters

The following values are required to calculate the boost factor:

- stall current ( $I_{0}$ , p0318, catalog value)
- thermal stall current ( $I_{th0}$ , catalog value)

The boost factor is calculated as follows:

- $p5350 = (I_{0} / I_{th0})^2$

**Dependency:** Refer to: p0318, p0612, p5390, p5391

Refer to: F07011, A07012, A07014

**Notice:** When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:** Temperature model 1 (I2t):

The following applies for firmware version < 4.7 SP6 or p0612.8 = 0:

- parameter p5350 is not active. Internally, a fixed boost factor of 1.333 is used as basis for the calculation.

The following applies from firmware version 4.7 SP6 and p0612.8 = 1:

- parameter p5350 becomes active as described above.

**Note:** For bit 00, 04:

The motor temperature is measured using a temperature sensor (p0600, p0601). When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.

For bit 01, 05:

The motor temperature is monitored based on a temperature model (p0612). When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.

For bit 02:

The encoder temperature is measured using a temperature sensor. When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.

For bit 08:

When reaching the motor temperature alarm threshold, reduction of the maximum current is set as response (p0610 = 1). When the bit is set, reduction of the maximum current is active.

**Description:** Sets the alarm threshold for monitoring the motor temperature for motor temperature models 1 and 3.

The stator winding temperature (r0632) is used to initiate the signal.

The following applies for temperature model 1 (I2t):

- only effective from firmware version 4.7 SP6 and p0612.8 = 1.
- Alarm A07012 is output after the alarm threshold is exceeded.
- when commissioning a catalog motor for the first time, the threshold value is copied from p0605 to p5390.

The following applies for temperature model 3:

- after the alarm threshold is exceeded, alarm A07012 is output and a calculated delay time ( $t = p5371/p5381$ ) is started.
- if the delay time has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F07011 is output.

**Dependency:** Refer to: p7761, p7765, p7766, p7767, p7768

**Note:** KHP: Know-How Protection

For bit 00:  
Write protection can be activated/de-activated via p7761 on the Control Unit.

For bit 01:  
The know-how protection can be activated by entering a password (p7766 ... p7768).

For bit 02:  
If it has already been activated, know-how protection can be temporarily de-activated by entering the valid password in p7766. In this case, bit 1 = 0 and bit 2 = 1 offset.

For bit 03:  
Know-how protection cannot be de-activated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list.

For bit 04:  
When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards/Control Units. This bit is only set if know-how protection is active and p7765 bit 00 is set.

For bit 05:  
When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and in p7765 bit 01 is set and not bit 00.

For bit 06:  
When know-how protection is activated, the drive data can be traced using the device trace function. This bit is only set if know-how protection is active and in p7765.2 is set.

**Description:** OEM exception list (p7764[0...n]) for setting parameters that should be excluded from know-how protection.  
p7764[0...n], with n = p7763 - 1

**Dependency:** The number of indices depends on p7763.

Refer to: p7763

**Note:** KHP: Know-How Protection

Even if know-how protection is set, parameters in this list can be read and written to.

<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
-	-	0000 bin

**Description:** Configuration settings for know-how protection.

For bit 00, 01:

When KHP is activated, this means that the OEM can define whether the parameters and DCC data encrypted on the memory card should be protected before using on other memory cards/Control Units.

For bit 02:

This means that the OEM can define whether it is possible or not to trace the drive data using the device trace function although KHP is activated.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Extended copy protection - linked to the memory card and CU	Yes	No	-
	01	Basic copy protection - linked to the memory card	Yes	No	-
	02	Permit trace and measuring functions for diagnostic purposes	Yes	No	-

**Dependency:** Refer to: p7766, p7767, p7768

**Note:** KHP: Know-How Protection

For copy protection, the serial numbers of the memory card and/or Control Unit are checked.

The memory card copy protection and preventing data to be traced are only effective when the know-how protection has been activated.

For bit 00, 01:

If both bits are inadvertently set to 1 (e.g. at the BOP), then the setting of bit 0 applies.

There is no copy protection if both bits are set to 0.

<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
-	-	-

**Description:** Sets the password for know-how protection.

Example of a password:

123aBc = 49 50 51 97 66 99 dec (ASCII characters)

[0] = character 1 (e.g. 49 dec)

[1] = character 2 (e.g. 50 dec)

...

[5] = character 6 (e.g. 99 dec)

[29] = 0 dec (completes the entry)

**Dependency:** Refer to: p7767, p7768

**Notice:** An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.

When using the STARTER commissioning software, the password should be entered using the associated dialogs.

The following rules apply when entering the password:

- Password entry must start with p7766[0].

- no gaps are permissible in the password.

- Entering a password is completed when writing to p7766[29] (p7766[29] = 0 for passwords less than 30 characters).

**Note:** KHP: Know-How Protection

When reading, p7766[0...29] = 42 dec (ASCII character = "\*\*\*") is displayed.

Parameters with the "KHP\_WRITE\_NO\_LOCK" attribute are not involved in the know-how protection.

Parameters with the "KHP\_ACTIVE\_READ" attribute can be read even when know-how protection is activated.

A product-specific list of these parameters is also available in the corresponding List Manual.

**Dependency:** Refer to: p7765, p7766, p7767, p7768

**Note:** KHP: Know-How Protection  
- the OEM may only change this parameter for the use case "Sending encrypted SINAMICS data".  
- SINAMICS only evaluates this parameter when powering up from the encrypted "Load into file system..." output or when powering up from the encrypted PS files. The evaluation is only made when know-how protection and memory card copy protection have been activated.

**Description:** Setting to backup/import/delete NVRAM data.  
NVRAM data are non-volatile data in the device (e.g. fault buffer).

For NVRAM data actions, the following data are excluded:

- Crash diagnostics
- CU operating hours counter
- CU temperature
- safety logbook

**Value:**

- 14: Error when importing, memory card not available
- 15: Error when importing, checksum error
- 16: Error when importing, no NVRAM data available
- 17: Error when importing

- Notice:** For value = 2, 3:  
These actions are only possible when pulses are inhibited.
- Note:** After the action has been successfully completed, the parameter is automatically set to zero.  
The actions importing and deleting NVRAM data immediately initiate a warm restart.  
If the procedure was not successfully completed, then an appropriate fault value is displayed (p7775 >= 10).

## 2 Parameters

### 2.2 List of parameters

The Node ID can be set as follows:

1) Using the address switch on the Control Unit.

--> p8620 can then only be read and displays the selected Node ID.

--> A change only becomes effective after a POWER ON.

--> CANopen Node ID and PROFIBUS address are identical.

2) Using p8620

--> Only if address 0 is set using the address switch.

--> the Node ID is set as standard to 126.

--> A change only becomes effective after save and POWER ON.

**Dependency:**

Refer to: r8621

**Notice:**

For p0014 = 1, the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

For p0014 = 0, the following applies:

Before a changed setting becomes permanently effective, a non-volatile RAM to ROM data save is required. To do this, set p0971 = 1 or p0014 = 1.

**Note:**

Every node ID change only becomes effective after a POWER ON.

The active node ID is displayed in r8621.

The parameter is not influenced by setting the factory setting.

It is only possible to independently set CANopen node ID and the PROFIBUS address using p0918 and p8620 (prerequisite: the address 0 is set for the address switch).

**Description:** Sets the bit timing for the C\_CAN controller to the associated and selected bit rate (p8622).

Bits are distributed to the following parameters of the C\_CAN controller in p8623[0...7]:

Bit 0 ... 5: BRP (Baud Rate Prescaler)

Bit 6 ... 7: SJW (Synchronization Jump Width)

Bit 8 ... 11: TSEG1 (Time Segment 1, before the sampling point)

Bit 12 ... 14: TSEG2 (Time Segment 2, after the sampling point)

Bit 15: Reserved

Bit 16 ... 19: BRPE (Baud Rate Prescaler Extension)

Bit 20 ... 31: Reserved

Example:

Bit rate = 20 kbit/s --> p8622 = 6 --> associated bit timing is in p8623[6] --> 0001 2FB6

**Recommendation:** Use the factory setting when setting the bit timing.

 When the ramp-function generator is activated, the interconnection from CI: p2151 = r1119 can be changed, so that to evaluate bit 10, the setpoint can be retrieved (taken) from in front of the ramp-function generator.  
 For bit 10, 12:  
 When braking, the two bits must indicate the same state. This is the reason that the following parameters must be set the same:  
 p2161 (speed threshold value 3, for r2199.0) = p2163 (speed threshold value 4, for r2197.7)

### 2.2 List of parameters

**Dependency:** Refer to: p8807, p8808  
**Notice:** Only characters belonging to the standard ASCII character set may be used (32 dec to 126 dec).  
**Note:** An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.  
For p8806[0...31]:  
System identifier.  
For p8806[32...53]:  
Location identifier.

**Description:** Parameters for the PROFINET data set "Identification and Maintenance 2" (I&M 2).  
This information is known as "Installation date".

**Dependency:** Refer to: p8806, p8808  
**Note:** An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.  
For p8807[0...15]:  
Dates of installation or first commissioning of the device with the following format options (ASCII):  
YYYY-MM-DD  
or  
YYYY-MM-DD hh:mm  
- YYYY: year  
- MM: month 01 ... 12  
- DD: day 01 ... 31  
- hh: hours 00 ... 23  
- mm: minutes 00 ... 59  
Separators must be placed between the individual data, i.e. a hyphen '-', space ' ' and colon ':'.

**Description:** Parameters for the PROFINET data set "Identification and Maintenance 4" (I&M 4).  
This information is known as "Signature".

**Dependency:** This parameter is pre-assigned as standard (see note).  
After writing information to p8809, p8805 is automatically set to = 1.  
Refer to: p8805

**Note:** For p8805 = 0 (factory setting) the following applies:  
Parameter p8809 contains the information described below.  
For p8809[0...3]:  
Contains the value from r9781[0] "SI change tracking checksum functional".  
For p8809[4...7]:  
Contains the value from r9782[0] "SI change tracking time stamp checksum functional".  
For p8809[8...53]:

**Description:** Sets the function for the component selected in p9210.  
After initiating a function, the parameter is automatically reset again.  
Example:

- set the component number (p9210).
- select the "flashing on" function (set p9211 = 1).

**Value:** -1: Select function  
0: Flashing off  
1: Flashing on

**Dependency:** Refer to: p9210

**Notice:** If a task cannot be executed (e.g. the component number in p9210 does not exist), the following applies:  
- there is no negative feedback signal.  
- the value is reset anyway.

### 2.2 List of parameters

<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	00	Extended message acknowledgment	Yes	No	-
	01	Setpoint velocity limit for STOP F	No	Yes	-
<b>Dependency:</b>	Refer to: C01711				
<b>Notice:</b>	This parameter is overwritten by the copy function of the safety functions integrated in the drive.				
<b>Note:</b>	For bit 00: When the function is activated, a safety-relevant acknowledgment (internal event acknowledge) can be performed by selecting/deselecting STO.				
	For bit 01: When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.

#### p9309 SI Motion behavior during pulse suppression (processor 2) / SI Mtn behav IL P2

<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> Unsigned32
<b>Can be changed:</b> C(95)	<b>Scaling:</b> -	<b>Dyn. index:</b> -
<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
-	-	0000 0000 1111 1111 bin

**Description:** Sets the behavior of safety functions and their feedback during pulse suppression in encoderless operation.

<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	00	SSM during pulse suppression and sensorless	Becomes inactive	Remains active	-
	08	SDI during pulse suppression and sensorless	Becomes inactive	Remains active	-

**Dependency:** Refer to: C01711

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

For bit 00:

If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.

**Note:** SDI: Safe Direction (safe motion direction)

SSM: Safe Speed Monitor (safety-relevant feedback signal from the velocity monitoring)

For bit 00:

For bit = 1 and with the SSM safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.

For bit = 0 and with the SSM safety function activated, the following applies:

- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.

For bit 08:

For bit = 1 and with the SDI safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the status signal indicates inactive.

For bit = 0 and with the SDI safety function activated, the following applies:

- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

**Description:** Sets the denominator for the gearbox between the motor and the load.

**Index:**  
[0] = Gearbox 1  
[1] = Gearbox 2  
[2] = Gearbox 3

[3] = Gearbox 4  
 [4] = Gearbox 5  
 [5] = Gearbox 6  
 [6] = Gearbox 7  
 [7] = Gearbox 8

**Dependency:**

Refer to: p9322

**Notice:**

It is not possible to change over the gearbox stages. Gearbox 1 (index 0) is always active.

**p9322[0...7] SI Motion gearbox motor/load numerator (processor 2) / SI Mtn gear num P2**

<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> Unsigned32

<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
1	2147000000	1

**Description:**

Sets the numerator for the gearbox between the motor and the load.

**Index:**

[0] = Gearbox 1  
 [1] = Gearbox 2  
 [2] = Gearbox 3  
 [3] = Gearbox 4  
 [4] = Gearbox 5  
 [5] = Gearbox 6  
 [6] = Gearbox 7  
 [7] = Gearbox 8

**Dependency:**

Refer to: p9321

**Notice:**

It is not possible to change over the gearbox stages. Gearbox 1 (index 0) is always active.

**Note:**

In the case of encoderless monitoring functions, the pole pair number must be multiplied by the numerator of the gearbox ratio.

Example:

Gearbox ratio 1:4, pole pair number (r0313) = 2

--&gt; p9321 = 1, p9322 = 8 (4 x 2)

**Description:**

Sets the limit values for the function "Safely Limited Speed" (SLS).

**Index:**

[0] = Limit value SLS1  
 [1] = Limit value SLS2  
 [2] = Limit value SLS3  
 [3] = Limit value SLS4

**Dependency:**

Refer to: p9363, p9531

Refer to: C01714

**Notice:**

This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:**

SLS: Safely Limited Speed

<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> FloatingPoint32
<b>Can be changed:</b> C(95)	<b>Scaling:</b> -	<b>Dyn. index:</b> -
<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0.0010 [°]	360.0000 [°]	12.0000 [°]

**Description:**

Sets the tolerance for the crosswise data comparison of the actual position between processors 1 and 2.

**Dependency:**

Refer to: p9542

Refer to: C01711

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.  
**Note:** For a linear axis, the tolerance is internally limited to 10 mm.  
 For a "linear axis with rotating motor" and factory setting of p9320, p9321 and p9322, the factory setting of p9342 corresponds to a position tolerance of 36 ° on the motor side.

**p9345**      **SI Motion SSM filter time (processor 2) / SI Mtn SSM filt P2**

<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> FloatingPoint32

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0.00 [µs]	100000.00 [µs]	0.00 [µs]

**Description:** Sets the filter time for the SSM feedback signal to detect standstill.  
**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.  
**Note:** The filter time is effective only if the function is enabled (p9301.16 = p9501.16 = 1).  
 The set time is rounded internally to an integer multiple of the monitoring clock cycle.  
 The parameter is included in the crosswise data comparison of the two monitoring channels.  
 SSM: Safe Speed Monitor (safety-relevant feedback signal from the velocity monitoring)

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0.00 [rpm]	100000.00 [rpm]	20.00 [rpm]

**Description:** Sets the velocity limit for the SSM feedback signal to detect standstill (n < nx).  
 When this limit value is undershot, the signal "SSM feedback signal active" is set.  
**Dependency:** Refer to: p9546  
**Caution:**  The following applies for p9306 = 3:  
 The "SAM" function is switched out if the selected threshold value is undershot.  
**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.  
**Note:** SAM: Safe Acceleration Monitor (safe acceleration monitoring)  
 SSM: Safe Speed Monitor (safety-relevant feedback signal from the velocity monitoring)

**p9347**      **SI Motion SSM velocity hysteresis (processor 2) / SI Mtn SSM Hyst P2**

<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> FloatingPoint32

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0.0010 [rpm]	500.0000 [rpm]	10.0000 [rpm]

**Description:** Sets the velocity hysteresis for the SSM feedback signal to detect standstill (n < nx).  
**Dependency:** Refer to: C01711  
**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.  
**Note:** The velocity hysteresis is effective only if the function is enabled (p9301.16 = p9501.16 = 1).  
 The parameter is included in the crosswise data comparison of the two monitoring channels.  
 SSM: Safe Speed Monitor (safety-relevant feedback signal from the velocity monitoring)

**Description:** Sets the delay time for the SLS changeover for the function "safely limited speed" (SLS).  
When transitioning from a higher to a lower safely limited velocity/speed stage, within this delay time, the "old" velocity stage remains active.  
Even if SLS is activated from the state "SLS in active", then this delay is still applied.

**Description:** Sets the delay time for monitoring the brake ramp.  
Monitoring of the brake ramp starts once the delay time has elapsed.

**Dependency:** Refer to: p9381, p9383

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:** The set time is rounded internally to an integer multiple of the monitoring clock cycle.  
Internally, the set time is limited downwards to 2 safety monitoring clock cycles (2 \* 12 ms).

<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -	
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
-1	4	-1	

**Description:** Sets the tolerance of the plausibility monitoring of the current and voltage angle.  
A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps.  
An increase is advantageous, if the current or voltage at the motor become small.

<b>Dependency:</b>	Refer to: p9507 Refer to: F30681, C30711
<b>Notice:</b>	This parameter is overwritten by the copy function of the safety functions integrated in the drive. Reducing this value can adversely affect the actual value sensing and the plausibility check. When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).
<b>Note:</b>	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For synchronous motors, the value 4 must be set. If value = -1: - for synchronous motors, the calculation is automatically made with the value 4. - for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
5.00 [ms]	1000.00 [ms]	100.00 [ms]

**Description:** Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled.  
The value must be greater than or equal to the motor magnetizing time (p0346).

**Dependency:** Refer to: C30711

**Caution:** The safety functionality is only completely guaranteed after this time has expired.

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.  
If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C30711 with the message value 1041 or 1042.

**Note:** This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).  
The set time is rounded internally to an integer multiple of the monitoring clock cycle.

**Description:** Sets the filter time for smoothing the actual value with sensorless actual value sensing.

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.  
A longer filter time results in a longer response time.

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0.00 [%]	1000.00 [%]	10.00 [%]

**Description:** Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA).  
- the value must be increased if C30711 has occurred with message value 1042.  
- the value must be decreased if C30711 has occurred with message value 1041.

For synchronous motors, the following condition must be fulfilled:

$$|p0305 \times p9783| \geq p9388 \times 1.2$$

**Recommendation:** If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.

**Dependency:** Refer to: r9785  
Refer to: C30711

## 2 Parameters

### 2.2 List of parameters

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.  
If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
10.00 [%]	3300.00 [%]	100.00 [%]

**Description:** Sets the acceleration limit to filter velocity fluctuations.  
If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur.  
If this value is decreased, and this dampens the velocity peaks when accelerating.  
- the value must be increased if C30711 with message value 1043 has occurred.  
- the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.

**Recommendation:** The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration.

To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9389, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.

**Dependency:** Refer to: r9784  
Refer to: C30711

**Description:** Sets the behavior of safety functions and their feedback during pulse suppression in encoderless operation.

<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	00	SSM during pulse suppression and sensorless	Becomes inactive	Remains active	-
	08	SDI during pulse suppression and sensorless	Becomes inactive	Remains active	-

**Dependency:** Refer to: C01711

**Notice:** For bit 00:  
If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.

**Note:** SDI: Safe Direction (safe motion direction)  
SSM: Safe Speed Monitor (safety-relevant feedback signal from the velocity monitoring)  
For bit 00:  
For bit = 1 and with the SSM safety function activated, the following applies:  
- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.  
For bit = 0 and with the SSM safety function activated, the following applies:  
- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.  
For bit 08:  
For bit = 1 and with the SDI safety function activated, the following applies:  
- During pulse suppression, monitoring is switched off and the status signal indicates inactive.  
For bit = 0 and with the SDI safety function activated, the following applies:  
- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

<b>Description:</b>	This is an evaluation factor to define the setpoint limit from the selected actual speed limit. The active SLS limit value is evaluated with this factor and is made available as setpoint limit in r9733.		
<b>Dependency:</b>	This parameter only has to be parameterized for the motion monitoring functions integrated in the drive (p9601.2 = 1) r9733[0] = p9531[x] x p9533 (converted from the load side to the motor side) r9733[1] = - p9531[x] x p9533 (converted from the load side to the motor side) [x] = Selected SLS stage Conversion factor from the motor side to the load side: - motor type = rotary and axis type = linear: $p9522 / (p9521 \times p9520)$ - otherwise: p9522 / p9521 Refer to: p9501, p9531, p9601		

**Note:** The active actual speed limit is selected via PROFIsafe.  
 With STOP A, B, setpoint 0 is specified in r9733.  
 For p9533 = 0, the setpoint speed limit is de-activated and r9733[0] is set to p1082 and r9733[1] is set to -p1082.

<b>Description:</b>	Sets the tolerance of the plausibility monitoring of the current and voltage angle. A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps. An increase is advantageous, if the current or voltage at the motor become small.		
<b>Dependency:</b>	Refer to: r9787 Refer to: F01681, C01711		
<b>Notice:</b>	Reducing this value can adversely affect the actual value sensing and the plausibility check. When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).		
<b>Note:</b>	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For synchronous motors, the value 4 must be set. If value = -1: - for synchronous motors, the calculation is automatically made with the value 4. - for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

<b>Description:</b>	Sets the acceleration limit to filter velocity fluctuations. If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur. If this value is decreased, and this dampens the velocity peaks when accelerating. - the value must be increased if C01711 with message value 1043 has occurred. - the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.		
<b>Recommendation:</b>	The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration. To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9589, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.

**Value:**

1: Enable SBC

**Dependency:** Refer to: p9802

**Note:** The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9601 not equal to 0).

It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake.

It does not make sense to parameterize "motor holding brake the same as sequence control, connection via BICO" and enable "Safe Brake Control" (p1215 = 3, p9602 = p9802 = 1).

It is not permissible to parameterize "motor holding brake without feedback signals" and enable "Safe Brake Control" (p1278 = 1, p9602 = p9802 = 1).

<b>p9651</b>	<b>SI STO/SBC/SS1 debounce time (processor 1) / SI STO t_debou P1</b>		
<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> FloatingPoint32	
<b>Can be changed:</b> C(95)	<b>Scaling:</b> -	<b>Dyn. index:</b> -

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
0.00 [ms]	100.00 [ms]	1.00 [ms]	

**Description:** Sets the debounce time for the fail-safe digital input used to control STO/SBC/SS1.  
The debounce time is rounded to whole milliseconds.

**Note:** The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the fail-safe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions.

Example:

Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.

Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
0.00 [s]	300.00 [s]	0.00 [s]	

**Description:** Sets the delay time of the pulse suppression for the "Safe Stop 1" (SS1) function on processor 1 to brake along the OFF3 down ramp (p1135).

**Recommendation:** In order that the drive can completely ramp-down along the OFF3 ramp and a motor holding brake that is possibly available can close, then the delay time should be set as follows:

Motor holding brake parameterized: delay time  $\geq$  p1135 + p1228 + p1217

Motor holding brake not parameterized: delay time  $\geq$  p1135 + p1228

**Dependency:** Refer to: p1135, p9852

**Note:** For a crosswise data comparison between p9652 and p9852, a difference of one Safety monitoring clock cycle is tolerated.

The set time is rounded internally to an integer multiple of the monitoring clock cycle.

SS1: Safe Stop 1 (corresponds to Stop Category 1 acc. to EN60204)

**Description:** Displays the velocity resolution for safety-relevant motion monitoring functions.

For index 0:

Displays the safe velocity resolution (load side). Setpoints for velocity limits or parameter changes for velocities below this threshold have no effect.

For index 1:

Displays the safe velocity accuracy based on the safe encoder accuracy

**Index:** [0] = Actual velocity resolution  
[1] = Minimum velocity resolution

**Note:** Index 0: This parameter does not provide any information about the actual accuracy of the velocity sensing. This depends on the type of actual value sensing, the gear factors as well as the quality of the encoder being used.

Index 1: For a two-encoder system, with just non-safety capable encoders, this means the poorer value of the two encoders. Index[1] takes into account the coarse resolution of the encoder only

<b>Recommendation:</b>	For the ramp-function generator, by appropriately interconnecting the speed limits p1051 and p1052 with r9733[0, 1], a drive-based setpoint velocity limiting can be realized. - Cl: p1051 = r9733[0] - Cl: p1052 = r9733[1] Additional limiting can also be activated using connector input p1085 and p1088.		
<b>Index:</b>	[0] = Setpoint limiting positive [1] = Setpoint limiting negative [2] = Setpoint limit absolute		
<b>Dependency:</b>	For SLS: r9733[0] = p9531[x] x p9533 (converted from the load side to the motor side) For SDI negative: r9733[0] = 0 For SLS: r9733[1] = - p9531[x] x p9533 (converted from the load side to the motor side) For SDI positive: r9733[1] = 0 [x] = Selected SLS stage Conversion factor from the motor side to the load side: - motor type = rotary and axis type = linear: p9522 / (p9521 x p9520) - otherwise: p9522 / p9521 Refer to: p9531, p9533		
<b>Notice:</b>	If p1051 = r9733[0] is interconnected, p1052 = r9733[1] must also be interconnected and vice versa. If only the absolute value of the setpoint velocity limiting is required, r9733[2] must be interconnected.		
<b>Note:</b>	If the "SLS" function is not selected, r9733[0] shows p1082 and r9733[1] shows -p1082. The display in r9733 can be delayed by up to one Safety monitoring clock cycle as compared to the display in r9720 and r9722.

## 2 Parameters

### 2.2 List of parameters

Not all of the settings listed below will be permissible, depending on the Control Unit and Power Module being used:

0000 hex:

Safety functions integrated in the drive inhibited (no safety function).

0001 hex:

Basic functions are enabled via onboard terminals (permissible for r9771.0 = 1).

0004 hex:

Extended functions are enabled via onboard terminals (permissible for r9771.5 = 1).

0008 hex:

Basic functions are enabled via PROFIsafe (permissible for r9771.6 = 1).

0009 hex:

Basic functions are enabled via PROFIsafe onboard terminals (permissible for r9771.6 = 1).

000C hex:

Extended functions are enabled via PROFIsafe (permissible for r9771.4 = 1).

000D hex:

Extended functions are enabled via PROFIsafe and basic functions via onboard terminals (permissible for r9771.4 = 1).

In addition to all of the combinations listed above, using bit 7, the "STO via Power Module terminals" function can be enabled (this is permissible for r9771.19 = 1).

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Enable STO via terminals (processor 2)	Enable	Inhibit	2810
	02	Enable drive_integr motion_monitoring functions (processor 2)	Enable	Inhibit	-
	07	Enable Power Module STO	Enable	Inhibit	-

**Dependency:** Refer to: p9601, r9871

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:** A change only becomes effective after a POWER ON.

STO: Safe Torque Off

#### SI enable Safe Brake Control (processor 2) / SI enable SBC P2

<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> Integer32
<b>Can be changed:</b> C(95)	<b>Scaling:</b> -	<b>Dyn. index:</b> -
<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> 2814
<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0	1	0

**Description:** Sets the enable signal for the "Safe Brake Control" (SBC) function on processor 2.

0: Inhibit SBC

1: Enable SBC

**Dependency:** Refer to: p9602

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:** The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9801 not equal to 0).

It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake.

It does not make sense to parameterize "motor holding brake the same as sequence control, connection via BICO" and enable "Safe Brake Control" (p1215 = 3, p9602 = p9802 = 1).

It is not permissible to parameterize "motor holding brake without feedback signals" and enable "Safe Brake Control" (p1278 = 1, p9602 = p9802 = 1).

SBC: Safe Brake Control

<b>p9850</b>	<b>SI F-DI changeover discrepancy time (processor 2) / SI F-DI chg t P2</b>		
	<b>Access level:</b> 3	<b>Calculated:</b> -	<b>Data type:</b> FloatingPoint32
	<b>Can be changed:</b> C(95)	<b>Scaling:</b> -	<b>Dyn. index:</b> -

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00 [µs]	2000000.00 [µs]	500000.00 [µs]
<b>Description:</b>	Sets the discrepancy time for the changeover of the failsafe digital input for STO on processor 2. An F-DI changeover is not effective simultaneously due to the different runtimes in the two monitoring channels. After an F-DI changeover, dynamic data is not subject to a crosswise data comparison during this discrepancy time.		
<b>Dependency:</b>	Refer to: p9650		
<b>Notice:</b>	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
<b>Note:</b>	For a crosswise data comparison between p9650 and p9850, a difference of one Safety monitoring clock cycle is tolerated. The set time is rounded internally to an integer multiple of the monitoring clock cycle. F-DI: Failsafe Digital Input

	<b>Can be changed:</b> C(95)	<b>Scaling:</b> -	<b>Dyn. index:</b> -
	<b>Unit group:</b> -	<b>Unit selection:</b> -	<b>Func. diagram:</b> -
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00 [µs]	100000.00 [µs]	1000.00 [µs]
<b>Description:</b>	Sets the debounce time for the digital input used to control STO/SBC/SS1. The debounce time is rounded to whole milliseconds.		
<b>Notice:</b>	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
<b>Note:</b>	Rounding effects can occur in the last decimal place of the parameterized time. The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the fail-safe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions. Example: Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed. Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00 [ms]	300000.00 [ms]	0.00 [ms]
<b>Description:</b>	Sets the delay time of the pulse suppression for the "Safe Stop 1" (SS1) function on processor 2 to brake along the OFF3 down ramp (p1135).		
<b>Recommendation:</b>	In order that the drive can completely ramp-down along the OFF3 ramp and a motor holding brake that is possibly available can close, then the delay time should be set as follows: Motor holding brake parameterized: delay time $\geq$ p1135 + p1228 + p1217 Motor holding brake not parameterized: delay time $\geq$ p1135 + p1228		
<b>Dependency:</b>	Refer to: p1135, p9652		
<b>Notice:</b>	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
<b>Note:</b>	For a crosswise data comparison between p9652 and p9852, a difference of one Safety monitoring clock cycle is tolerated. Rounding effects can occur in the last decimal place of the parameterized time. The set time is rounded internally to an integer multiple of the monitoring clock cycle. <b>Description:</b>	Sets the target topology of the drive unit. The target topology is sub-divided into several sections. Each of the following data is saved under an index.	

General data on the topology:

- version
- attribute to compare the actual topology and target topology
- number of components

Data on a component:

- type component of the Node Identifier of the component
- number of DRIVE-CLiQ sockets in the Node Identifier
- manufacturer and version of the Node Identifier
- serial number of the Node Identifier (4 indices)
- index of the component
- order number (8 indices)
- attribute to compare the actual topology and target topology of the component

**Description:**

If, when comparing the actual topology and target topology, only error has occurred, that can be acknowledged, then using this parameter, a new comparison can be started - acknowledging the error in the target topology.

Differences that can be acknowledged:

- topology comparison, component shifted
- topology comparison, serial number of a component has been detected to be different (byte 3 = 1)
- topology comparison shows one component that is connected differently

The following parameter values are available:

p9904 = 1 --> the procedure is started.

p9904 = 0 after starting --> the procedure has been successfully completed.

p9904 = 1 after starting --> the procedure has not been successfully completed.

The possible causes for an unsuccessful procedure are located in bytes 4, 3, 2.

Byte 2:

Number of structural differences.

Byte 3:

Number of differences that can be acknowledged (p9904).

Byte 4:

Number of differences. These differences can be resolved as follows:

- sets the topology comparison (p9906 or p9907/p9908).
- change over the actual topology.

The appropriate action should be selected corresponding to the message that is displayed/output.

**Note:**

In order to permanently accept the acknowledgment of the fault that can be resolved, then it must be saved in a non-volatile fashion (p0977).

**Description:** Sets the delay time for testing the digital output.  
Within this time, for a forced checking procedure of the digital output, the signal must have been detected via the corresponding readback input (p10047).

**Dependency:** Refer to: p10003, p10007, p10017, p10046

**Note:** The delay time must be set to a value greater than the debounce time (p10017).

Regardless of p10001, the forced checking procedure will pause for at least two safety monitoring clock cycles between each stage of the test.

The test stop is only performed if the safety output is being used (see p10042).

**Description:** Select a fail-safe digital input (F-DI) for the signal "acknowledge internal event" (internal fault).  
The falling edge at this input resets the status "internal event" in the drive.  
The rising edge at this input acknowledges any existing discrepancy errors.

**Value:**  
0: Static selected  
1: F-DI 0  
2: F-DI 1  
3: F-DI 2  
255: Static deselected

**Dependency:** Refer to: p10106

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
0.00 [ms]	100.00 [ms]	1.00 [ms]

**Description:** Sets the debounce time for digital inputs.  
The debounce time is accepted rounded off to whole milliseconds.  
The debounce time acts on the following digital inputs:  
- Fail-safe digital inputs (F-DI).  
- Single-channel digital inputs (DI).  
- Single-channel digital input 5 (DI 5, read back input for the forced checking procedure).

**Dependency:** Refer to: p10117

**Note:** Example:  
Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.  
Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.  
The debounce result can be read in r10051.

## 2 Parameters

### 2.2 List of parameters

**Note:** If a safety function is assigned to an input (e.g. via p10022), then the following applies:

- logical "0": Safety function is selected
- logical "1": Safety function is de-selected

The interrelationship between the logical level and the external voltage level at the input depends on the parameterization (refer to p10040) of the input as either NC or NO contact and is aligned to the use of a safety function:

With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.

This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function.

With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.

This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function.

F-DI: Failsafe Digital Input

The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051.

The parameter is only updated in the following cases:

- if the Safety Extended Functions are enabled by means of activation via F-DI.
- if transfer of the F-DIs via PROFIsafe is enabled (see p9501).

In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
4.00 [ms]	2000.00 [ms]	500.00 [ms]

**Description:** Sets the delay time for testing the digital output.

Within this time, for a forced checking procedure of the digital output, the signal must have been detected via the corresponding readback input (p10047).

**Dependency:** Refer to: p10003, p10007, p10046

**Note:** The delay time must be set to a value greater than the debounce time (p10017).

Regardless of p10001, the forced checking procedure will pause for at least two safety monitoring clock cycles between each stage of the test.

The test stop is only performed if the safety output is being used (p10142).

**Description:** Sets the debounce time for digital inputs.  
The debounce time acts on the following digital inputs:  
- Fail-safe digital inputs (F-DI).  
- Single-channel digital input 2 (DI 2, read back input for the forced checking procedure).  
The debounce time is accepted rounded off to whole milliseconds.

**Dependency:** Refer to: p10017

**Note:** Example:  
Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.  
Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.  
The debounce result can be read in r10151.

<b>Dependency:</b>	Refer to: p9501, p9601, p10117, p10150				
<b>Note:</b>	F-DI: Failsafe Digital Input				
	If a safety function is assigned to an input (e.g. via p10122), then the following applies:				
	- logical "0": Safety function is selected				
	- logical "1": Safety function is de-selected				
	The interrelationship between the logical level and the external voltage level at the input depends on the parameterization (refer to p10140) of the input as either NC or NO contact and is aligned to the use of a safety function:				
	With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.				
	This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function.				
	With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.				
	This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function.				
	The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051.				
	The parameter is only updated in the following cases:				
	- if the Safety Extended Functions are enabled by means of activation via F-DI.				
	- if transfer of the F-DIs via PROFIsafe is enabled (see p9501).				
	In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

**Description:** Sets the telegram for the Safety Info Channel (SIC).

The SIC telegram p60122 is attached directly to the PZD telegram p0922/p2079.

**Value:** 700: Supplementary telegram 700, PZD-0/3  
999: Free telegram configuration with BICO

**Dependency:** Refer to: p0922, p2071, p2079

**Note:** The clearance to the PZD telegram can be increased using p2071.  
 After changing p0922/p2079 or p2071, then p60122 must be set again.  
 The telegram interconnections can only be changed if p60122 and p0922 are both set to 999.

## 2.5 Parameters for write protection and know-how protection

### 2.5.1 Parameters with "WRITE\_NO\_LOCK"

The following list contains the parameters with the "WRITE\_NO\_LOCK" attribute.

These parameters are not affected by the write protection.

Product: SINAMICS G120S, Version: 4707900, Language: eng, Type: WRITE\_NO\_LOCK

p0003	Access level / Acc_level
p0010	Drive commissioning parameter filter / Drv comm. par_filt
p0124[0...n]	CU detection via LED / CU detection LED
p0791[0...1]	CO: Fieldbus analog outputs / Fieldbus AO
p0970	Reset drive parameters / Drive par reset
p0971	Save parameters / Save par
p0972	Drive unit reset / Drv_unit reset
p2111	Alarm counter / Alarm counter
p3950	Service parameter / Serv par
p3981	Faults acknowledge drive object / Faults ackn DO
p3985	Master control mode selection / PcCtrl mode select
p7761	Write protection / Write protection
p8805	Identification and maintenance 4 configuration / I&M 4 config
p8806[0...53]	Identification and Maintenance 1 / I&M 1
p8807[0...15]	Identification and Maintenance 2 / I&M 2
p8808[0...53]	Identification and Maintenance 3 / I&M 3
p8809[0...53]	Identification and Maintenance 4 / I&M 4
p9210	Flashing component number / Flash comp_no.
p9211	Flash function / Flash fct.
p9400	Safely remove memory card / Mem_card rem
p9484	BICO interconnections search signal source / BICO S_src srch

### 2.5.2 Parameters with "KHP\_WRITE\_NO\_LOCK"

The following list contains the parameters with the "KHP\_WRITE\_NO\_LOCK" attribute.

These parameters are not affected by the know-how protection.

Product: SINAMICS G120S, Version: 4707900, Language: eng, Type: KHP\_WRITE\_NO\_LOCK

p0003	Access level / Acc_level
p0010	Drive commissioning parameter filter / Drv comm. par_filt
p0124[0...n]	CU detection via LED / CU detection LED
p0791[0...1]	CO: Fieldbus analog outputs / Fieldbus AO
p0970	Reset drive parameters / Drive par reset
p0971	Save parameters / Save par
p0972	Drive unit reset / Drv_unit reset
p2040	Fieldbus interface monitoring time / Fieldbus t_monit
p2111	Alarm counter / Alarm counter
p3950	Service parameter / Serv par
p3981	Faults acknowledge drive object / Faults ackn DO
p3985	Master control mode selection / PcCtrl mode select
p7761	Write protection / Write protection
p8805	Identification and maintenance 4 configuration / I&M 4 config
p8806[0...53]	Identification and Maintenance 1 / I&M 1
p8807[0...15]	Identification and Maintenance 2 / I&M 2

p8808[0...53]	Identification and Maintenance 3 / I&M 3
p8809[0...53]	Identification and Maintenance 4 / I&M 4
p8980	Ethernet/IP profile / Eth/IP profile
p8981	Ethernet/IP ODVA STOP mode / Eth/IP ODVA STOP
p8982	Ethernet/IP ODVA speed scaling / Eth/IP ODVA n scal
p8983	Ethernet/IP ODVA torque scaling / Eth/IP ODVA M scal
p9210	Flashing component number / Flash comp_no.
p9211	Flash function / Flash fct.
p9400	Safely remove memory card / Mem_card rem
p9484	BICO interconnections search signal source / BICO S_src srch

### 2.5.3 Parameters with "KHP\_ACTIVE\_READ"

The following list contains the parameters with the "KHP\_ACTIVE\_READ" attribute.

These parameters can also be read with activated know-how protection.

Product: SINAMICS G120S, Version: 4707900, Language: eng, Type: KHP\_ACTIVE\_READ

p0015	Macro drive unit / Macro drv unit
p0100	IEC/NEMA mot stds / IEC/NEMA mot stds
p0108[0...n]	Function module 1 / Fct_module 1
p0140	Number of Encoder Data Sets (EDS) / EDS count
p0142[0...n]	Encoder component number / Encoder comp_no
p0170	Number of Command Data Sets (CDS) / CDS count
p0180	Number of Drive Data Sets (DDS) / DDS count
p0300[0...n]	Motor type selection / Mot type sel
p0304[0...n]	Rated motor voltage / Mot U_rated
p0305[0...n]	Rated motor current / Mot I_rated
p0400[0...n]	Encoder type selection / Enc_typ sel
p0505	Selecting the system of units / Unit sys select
p0595	Technological unit selection / Tech unit select
p0730	BI: CU signal source for terminal DO 0 / CU S_src DO 0
p0731	BI: CU signal source for terminal DO 1 / CU S_src DO 1
p0732	BI: CU signal source for terminal DO 2 / CU S_src DO 2
p0806	BI: Inhibit master control / PcCtrl inhibit
p0922	PROFIdrive PZD telegram selection / PZD teleg_r_sel
p1080[0...n]	Minimum speed / n_min
p1082[0...n]	Maximum speed / n_max
p1520[0...n]	CO: Torque limit upper / M_max upper
p2000	Reference speed reference frequency / n_ref f_ref
p2001	Reference voltage / Reference voltage
p2002	Reference current / I_ref
p2003	Reference torque / M_ref
p2005	Reference angle / Reference angle
p2006	Reference temp / Ref temp
p2007	Reference acceleration / a_ref
p2030	Field bus int protocol selection / Field bus protocol
p2038	PROFIdrive STW/ZSW interface mode / PD STW/ZSW IF mode
p2079	PROFIdrive PZD telegram selection extended / PZD teleg_r_ext
p7763	KHP OEM exception list number of indices for p7764 / KHP OEM qty p7764
p7764[0...n]	KHP OEM exception list / KHP OEM excep list
p9601	SI enable functions integrated in the drive (processor 1) / SI enable fct P1
p9810	SI PROFIsafe address (processor 2) / SI PROFIsafe P2
p9902	Target topology number of indices / TargetTopo indices

## 2.6 Quick commissioning (p0010 = 1)

The parameters required for the quick commissioning (p0010=1) are shown in the following table:

Table 2-7 Quick commissioning (p0010 = 1)

Par. no.	Name	Access level	Can be changed
p0010	Drive, commissioning parameter filter	1	C(1)T
p0015	Macro drive unit	1	C,C(1)
p0096	Application class	1	C(1)
p0100	IEC/NEMA mot stds	1	C(1)
p0205	Power unit application	1	C(1,2)
p0230	Drive filter type, motor side	1	C(1,2)
p0300	Motor type selection	2	C(1,3)
p0301	Motor code number selection	2	C(1,3)
p0304	Rated motor voltage	1	C(1,3)
p0305	Rated motor current	1	C(1,3)
p0306	Number of motors connected in parallel	1	C(1,3)
p0307	Rated motor power	1	C(1,3)
p0308	Rated motor power factor	1	C(1,3)
p0309	Rated motor efficiency	1	C(1,3)
p0310	Rated motor frequency	1	C(1,3)
p0311	Rated motor speed	1	C(1,3)
p0314	Motor pole pair number	3	C(1,3)
p0316	Motor torque constant	3	C(1,3)UT
p0322	Maximum motor speed	1	C(1,3)
p0323	Maximum motor current	1	C(1,3)
p0335	Motor cooling type	2	C(1,3)T
p0400	Encoder type selection	1	C(1,4)
p0402	Gear unit type selection	1	C(1,4)
p0500	Technology application	2	C(1,5)T
p0640	Current limit	2	C(1,3)UT
p0922	PROFIdrive telegram selection	1	C(1)T
p0970	Reset drive parameters	1	C(1,30)
p1080	Minimum speed	1	C(1)T
p1082	Maximum rotation speed	1	C(1)T
p1120	Ramp-function generator ramp-up time	1	C(1)UT
p1121	Ramp-function generator ramp-down time	1	C(1)UT
p1135	OFF3 ramp-down time	2	C(1)UT

Table 2-7 Quick commissioning (p0010 = 1), continued

Par. no.	Name	Access level	Can be changed
p1300	Open-loop/closed-loop control operating mode	2	C(1)T
p1500	Torque setpoint selection	2	C(1)T
p1900	Motor data identification and rotating measurement	1	C(1)T
p1905	Parameter tuning selection	1	C(1)T
p2196	Torque utilization scaling	1	C(1,3)UT
p3900	Completion of quick commissioning	1	C(1)

If p0010 = 1 is selected, p0003 (user access level) can be used to select the parameters that are to be accessed.

At the end of the quick commissioning, set p3900 = 1 to perform the required motor calculations and reset all other parameters (not included in p0010 = 1) to their default settings.

Fig. 3-4 1030 – Handling BICO technology

### Handling BICO technology

**Binector:**  Binectors are binary signals that can be freely interconnected (BO = Binector Output). They represent a bit of a "BO:" display parameter (e.g. bit 15 from r0723).

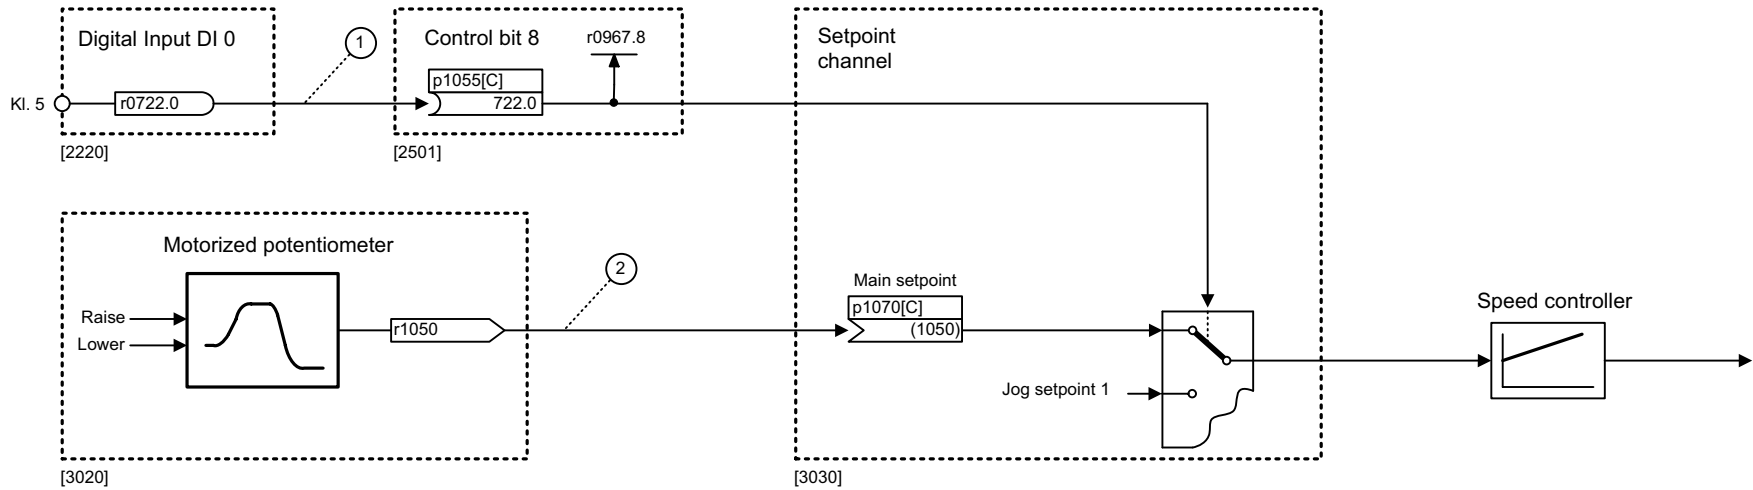

**Connector:**  Connectors are "analog signals" that can be freely interconnected (e.g. percentage variables, speeds or torques). Connectors are also "CO:" display parameters (CO = Connector Output).

**Parameterization:**

At the signal destination, the required binector or connector is selected using appropriate parameters:  
"BI:" parameter for binectors (BI = Binector Input)  
or  
"CI:" parameter for connectors (CI = Connector Input)

**Example:**

The main setpoint for the speed controller (CI: p1070) should be received from the output of the motorized potentiometer (CO: r1050) and the "jog" command (BI: p1055) from Digital Input DI 0 (BO: r0722.0, Terminal 5 (Kl. 5)) on the CU.

**Parameterizing steps:**

- ① p1055[0] = 722.0 Terminal 5 (Kl. 5) acts as "Jog bit 0".
- ② p1070[0] = 1050 The output of the motorized potentiometer acts as main setpoint for the speed controller.

<1> Differential Input!  
For an input signal referred to ground, KI. 4 (KI. 11) must be connected to reference potential M.  
Notice:  
The voltage between inputs and between input and the ground point must not exceed 35 V.  
When the load resistor is switched in (DIP switch in position ↑), the voltage between the input terminals must not exceed 10 V or the impressed current 80 mA. If this is not observed, the input will be damaged.

<2> For p0756 = 2, 3 the units are mA.  
For p0756 = 0, 1, 4 the units are V.

- <1> To comply with the PROFIdrive profile, send word 1 must be used as status word 1 (ZSW1).
- <2> Physical word values are inserted in the telegram as referenced variables. p200x apply as reference variables (telegram contents = 4000 hex, if the input variable has the value p200x). The following applies for temperature values: 100° C -> 100 % = 4000 hex; 0° C -> 0%.
- <3> A PZD send word can either be supplied via connector input p2051[x] (WORD) or via p2061[x] (DWORD). The two corresponding connector inputs cannot be interconnected.

<1> When "reference point approach" is selected (active referencing p2597 = 0 signal), this function diagram is of no significance => refer to [3612].  
Active traversing is not directly associated with the "flying referencing" mode (passive referencing, p2597 = 1 signal).  
The mode can be superimposed on the "jog" [3610], "traversing blocks" [3614] and "direct setpoint input/MDI" [3618] modes!

<1> When the "reference point approach" mode is active, the velocity override influences the approach velocity reference cams (p2605). However, the approach velocity reference zero mark (p2608) and the approach velocity reference point (p2611) are not influenced.  
<2> The STOP cams are low active.  
When a cam responds, the drive brakes with maximum deceleration along the ramp. After the fault has been acknowledged, only movements away from the STOP cam are permitted.

<1> This function block randomly adapts output variable Y to input variable X by means of up to 20 breakpoints in 4 quadrants. Interpolation is carried out linearly between the breakpoints. Outlying the area A0 to A19, the characteristic curve runs horizontally. During configuration, you must ensure that the values of A0 to A19 are arranged in ascending order. Otherwise the values at the output will not be correct. The values B0 to B19 can be selected at random, i.e., independently of the previous value. If breakpoints are not needed (e.g., A16/B16 and higher), the following values of the X- and Y-coordinates (A16/B16 to A19/B19) must be assigned the same values as A15/B15.

# Faults and alarms

## Content

4.1	Overview of faults and alarms	976
4.2	List of faults and alarms	988

## 4.1 Overview of faults and alarms

### 4.1.1 General

#### Fault and alarm displays (messages)

In the case of a fault, the drive signals the corresponding fault(s) and/or alarm(s).

For example, the following methods for displaying faults and alarms are available:

- Display via the fault and alarm buffer with PROFIBUS/PROFINET
- Display online via the commissioning software
- Display and operating unit (e.g. BOP, AOP)

#### Differences between faults and alarms

The differences between faults and alarms are as follows:

Table 4-1 Differences between faults and alarms

Type	Description
Faults	<p>What happens when a fault occurs?</p> <ul style="list-style-type: none"> <li>• The appropriate fault response is triggered.</li> <li>• Status bit ZSW1.3 is set.</li> <li>• The fault is entered in the fault buffer.</li> </ul> <p>How are faults eliminated?</p> <ul style="list-style-type: none"> <li>• Remove the original cause of the fault.</li> <li>• Acknowledge the fault.</li> </ul>
Alarms	<p>What happens when an alarm occurs?</p> <ul style="list-style-type: none"> <li>• Status signal ZSW1.7 is set.</li> <li>• The alarm is entered into the alarm buffer.</li> </ul> <p>How are alarms eliminated?</p> <ul style="list-style-type: none"> <li>• Alarms acknowledge themselves. If the cause of the alarm is no longer present, they automatically reset themselves.</li> </ul>

## Fault reactions

The following fault reactions are defined:

Table 4-2 Fault reactions

List	PROFIdrive	Reaction	Description
NONE	-	None	No response when a fault occurs.  <b>Note:</b> With "Basic positioner" (r0108.4 = 1), the following applies: When a fault occurs with fault reaction "NONE", an active traversing task is interrupted and the system switches to tracking mode until the fault has been rectified and acknowledged.
OFF1	ON/ OFF	Brake along the ramp-function generator down ramp followed by pulse inhibit	<b>Closed loop speed control (p1300 = 20, 21)</b> <ul style="list-style-type: none"> <li>n_set = 0 is input immediately to brake the drive along the ramp-function generator ramp down (p1121).</li> <li>When zero speed is detected, the motor holding brake (if parameterized) is closed (p1215). The pulses are suppressed when the brake application time (p1217) expires. Zero speed is detected if the actual speed drops below the threshold in p1226 or if the monitoring time (p1227) started when speed setpoint &lt;= speed threshold (p1226) has expired.</li> </ul> <b>Torque control (p1300 = 22, 23)</b> <ul style="list-style-type: none"> <li>The following applies for closed-loop torque control: Reaction as for OFF2.</li> <li>When the system switches to closed-loop torque control with p1501, the following applies: No separate braking reaction. If the actual speed value drops below the speed threshold (p1226) or the timer stage (p1227) has expired, the motor holding brake (if one is being used) is closed. The pulses are suppressed when the brake application time (p1217) expires.</li> </ul>
OFF1_ DELAYED	-	As for OFF1, however delayed	Faults with this fault response only become effective after the delay time in p3136 has expired. The remaining time up to OFF1 is displayed in r3137.
OFF2	COAST STOP	Internal/external pulse disable	<b>Speed and torque control</b> <ul style="list-style-type: none"> <li>Instantaneous pulse suppression, the drive "coasts" to a standstill.</li> <li>The motor holding brake (if one is being used) is closed immediately.</li> <li>Switching-on inhibited is activated.</li> </ul>

## 4 Faults and alarms

### 4.1 Overview of faults and alarms

Table 4-2 Fault reactions, continued

List	PROFIdrive	Reaction	Description

IASC/DCBRK	-	-	<ul style="list-style-type: none"> <li>For synchronous motors, the following applies: If a fault occurs with this fault reaction, an internal armature short-circuit is triggered. The conditions for p1231 = 4 must be observed.</li> <li>For induction motors, the following applies: If a fault occurs with this fault reaction, DC braking is triggered. DC braking must have been commissioned (p1230 to p1239).</li> </ul>

## Acknowledging faults

The list of faults and alarms specifies how to acknowledge each fault after the cause has been eliminated.

Table 4-3 Acknowledging faults

Acknowledgment	Description
POWER ON	<p>The fault is acknowledged via a POWER ON (switch Control Unit off and on again).</p> <p><b>Note:</b> If this action has not removed the fault cause, the fault is displayed again immediately after power up.</p>
IMMEDIATELY	<p>Faults can be acknowledged as follows:</p> <ol style="list-style-type: none"> <li>1 Set acknowledgment by parameter: p3981 = 0 --&gt; 1</li> <li>2 Acknowledging via binector inputs: <ul style="list-style-type: none"> <li>p2103 BI: 1. Acknowledge faults</li> <li>p2104 BI: 2. Acknowledge faults</li> <li>p2105 BI: 3. Acknowledge faults</li> </ul> </li> <li>3 Acknowledging using a PROFIBUS control signal: STW1.7 = 0 --&gt; 1 (edge)</li> </ol> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>• These faults can also be acknowledged by a POWER ON operation.</li> <li>• If this action has not eliminated the fault cause, the fault will continue to be displayed after acknowledgment.</li> <li>• Safety Integrated faults The "Safe Torque Off" (STO) function must be deselected before these faults are acknowledged.</li> </ul>
PULSE SUPPRESSION	<p>The fault can only be acknowledged when the pulses are inhibited (r0899.11 = 0).</p> <p>The same options are available for acknowledging as described under IMMEDIATE acknowledgment.</p>

### 4.1.2 Explanation of the list of faults and alarms

The data in the following example have been chosen at random. The information listed below is the maximum amount of information that a description can contain. Some of the information is optional.

The "List of faults and alarms" (Page 988) has the following layout:

----- **Start of example** -----

---

<b>Axxxxx (F, N)</b>	<b>Fault location (optional): Name</b>
<b>Message class:</b>	Text of the message class (number according to PROFIdrive)
<b>Reaction:</b>	NONE
<b>Acknowledgement:</b>	NONE
<b>Cause:</b>	Description of possible causes. Fault value (r0949, interpret format): or alarm value (r2124, interpret format): (optional) Information about fault or alarm values (optional).
<b>Remedy:</b>	Description of possible remedies.

----- **End of example** -----

<b>Axxxxx</b>	<b>Alarm xxxxx</b>
<b>Axxxxx (F, N)</b>	<b>Alarm xxxxx (message type can be changed to F or N)</b>
<b>Fxxxxx</b>	<b>Fault xxxxx</b>
<b>Fxxxxx (A, N)</b>	<b>Fault xxxxx (report type can be changed to A or N)</b>
<b>Nxxxxx</b>	<b>No message</b>
<b>Nxxxxx (A)</b>	<b>No message (message type can be changed to A)</b>
<b>Cxxxxx</b>	<b>Safety message (separate message buffer)</b>

A message comprises a letter followed by the relevant number.

The meaning of the letters is as follows:

- A means "Alarm"
- F means "Fault"
- N means "No message" or "Internal message"
- C means "Safety message"

The optional brackets indicate whether the type specified for this message can be changed and which message types can be adjusted via parameters (p2118, p2119).

Information on reaction and acknowledgment is specified independently for a message with an adjustable message type (e.g. reaction to F, acknowledgment for F).

---

**Note**

You can change the default properties of a fault or alarm by setting parameters.

References: /BA13/ SINAMICS G120 Operating Instructions, Frequency Inverter with CU250S-2 Control Units (Vector), Section "Alarms, faults, and system messages"

The "List of faults and alarms" (Page 988) supplies information referred to the properties of a message set as default. If the properties of a specific message are changed, the corresponding information may have to be modified in this list.

---

**Fault location (optional): Name**

The fault location (optional), the name of the fault or alarm and the message number are all used to identify the message (e.g. with the commissioning software).

**Message value:**

The information provided under the message value informs you about the composition of the fault/alarm value.

**Example:**

Message value: Component number: %1, fault cause: %2

This message value contains information about the component number and cause of the fault. The entries %1 and %2 are placeholders, which are filled appropriately in online operation (e.g. with the commissioning software).

**Message class:**

For each message, specifies the associated message class with the following structure:

Text of the message class (number according to PROFIdrive)

The message classes are transferred at different interfaces to higher-level control systems and their associated display and operating units.

The message classes that are available are shown in Table "Message classes and coding of various diagnostic interfaces" (Page 982). In addition to the text of the message class and their number according to PROFIdrive – as well as a brief help text regarding the cause and remedy – they also include information about the various diagnostic interfaces:

- PN (hex)
  - Specifies the "Channel error type" of the PROFINET channel diagnostics.
  - When activating the channel diagnostics, using the GSDML file, the texts listed in the table can be displayed.
- DS1 (dec)
  - Specifies the bit number in data set DS1 of the diagnostic alarm for SIMATIC S7.
  - When the diagnostic alarms are activated, the texts listed in the table can be displayed.
- DP (dec)
  - Specifies the "Error type" of the channel-related diagnostics for PROFIBUS.
  - When the channel diagnostics are activated, the texts listed in the standard and the GSD file can be displayed.
- ET 200 (dec)
  - Specifies the "Error type" of the channel-related diagnostics for the SIMATIC ET 200pro FC-2 device.
  - When the channel diagnostics are activated, the texts listed in the standard and the GSD file of the ET 200pro can be displayed.
- NAMUR (r3113.x)
  - Specifies the bit number in parameter r3113.

## 4 Faults and alarms

### 4.1 Overview of faults and alarms

For the interfaces DP, ET 200, NAMUR, in some instances, the message classes are combined.

Table 4-4 Message classes and coding of various diagnostic interfaces

Text of the message class (number according to PROFIdrive) Cause and remedy.	Diagnostics interface				
	PN (hex)	DS1 (dec)	DP (dec)	ET 200 (dec)	NAMUR (r3113.x)
<b>Hardware/software errors (1)</b> A hardware or software malfunction was detected. Carry out a POWER ON for the relevant component. If it occurs again, contact the hotline.	9000	0	16	9	0
<b>Line fault (2)</b> A line supply fault has occurred (phase failure, voltage level ...). Check the line supply and fuses. Check the supply voltage. Check the wiring.	9001	1	17	24	1
<b>Supply voltage fault (3)</b> An electronics supply voltage fault (48 V, 24 V, 5 V ...) was detected. Check the wiring. Check the voltage level.	9002	2	2 <sup>1</sup> 3 <sup>2</sup>	2 <sup>1</sup> 3 <sup>2</sup>	15
<b>DC-link overvoltage (4)</b> The DC-link voltage has assumed an inadmissibly high value. Check the dimensioning of the system (line supply, reactor, voltages). Check the infeed settings.	9003	3	18	24	2
<b>Power electronics fault (5)</b> An impermissible operating state of the power electronics was detected (overcurrent, overtemperature, IGBT failure ...). Check compliance with the permissible load cycles. Check the ambient temperatures (fan).	9004	4	19	24	3
<b>Overtemperature of the electronic component (6)</b> The temperature in the component has exceeded the highest permissible limit. Check the ambient temperature / control cabinet ventilation.	9005	5	20	5	4
<b>Ground fault / inter-phase short-circuit detected (7)</b> A ground fault / inter-phase short-circuit was detected in the power cables or in the motor windings. Check the power cables (connection). Check the motor.	9006	6	21	20	5
<b>Motor overload (8)</b> The motor was operated outside the permissible limits (temperature, current, torque ...). Check the load cycles and set limits. Check the ambient temperature / motor cooling.	9007	7	22	24	6
<b>Communication to the higher-level controller faulted (9)</b> The communication to the higher-level controller (internal coupling, PROFIBUS, PROFINET ...) is faulted or interrupted. Check the state of the higher-level controller. Check the communication connection/-wiring. Check the bus configuration/cycles.	9008	8	23	19	7
<b>Safety monitoring channel has detected an error (10)</b> A safe operation monitoring function has detected an error.	9009	9	24	25	8

Text of the message class (number according to PROFIdrive) Cause and remedy.	Diagnostics interface				
	PN (hex)	DS1 (dec)	DP (dec)	ET 200 (dec)	NAMUR (r3113.x)
<b>Actual position/speed value incorrect or not available (11)</b> An illegal signal state was detected while evaluating the encoder signals (track signals, zero marks, absolute values ...). Check the encoder / state of the encoder signals. Observe the maximum permissible frequencies.	900A	10	25	29	9
<b>Internal (DRIVE-CLiQ) communication faulted (12)</b> The internal communication between the SINAMICS components is faulted or interrupted. Check the DRIVE-CLiQ wiring. Ensure an EMC-compliant installation. Observe the maximum permissible quantity structures / cycles.	900B	11	26	31	10
<b>Infeed fault (13)</b> The infeed is faulty or has failed. Check the infeed and its environment (line supply, filters, reactors, fuses ...). Check the infeed control.	900C	12	27	24	11
<b>Braking controller / Braking Module faulted (14)</b> The internal or external Braking Module is faulted or overloaded (temperature). Check the connection/state of the Braking Module. Comply with the permissible number of braking operations and their duration.	900D	13	28	24	15
<b>Line filter fault (15)</b> The line filter monitoring has detected an excessively high temperature or another impermissible state. Check the temperature / temperature monitoring. Check the configuration to ensure that it is permissible (filter type, infeed, thresholds).	900E	14	17	24	15
<b>External measured value / signal state outside of the permissible range (16)</b> A measured value / signal state read in via the input area (digital/analog/temperature) has assumed an impermissible value/state. Identify and check the relevant signal. Check the set thresholds.	900F	15	29	26	15
<b>Application / technological function faulty (17)</b> The application / technological function has exceeded a (set) limit (position, velocity, torque ...). Identify and check the relevant limit. Check the setpoint specification of the higher-level controller.	9010	16	30	9	15
<b>Error in the parameterization/configuration/commissioning procedure (18)</b> An error was identified in the parameterization or in a commissioning procedure, or the parameterization does not match the actual device configuration. Determine the precise cause of the fault using the commissioning tool. Adapt the parameterization or device configuration.	9011	17	31	16	15

<b>General drive fault (19)</b> Group fault. Determine the precise cause of the fault using the commissioning tool.	9012	18	9	9	15
<b>Auxiliary unit fault (20)</b> The monitoring of an auxiliary unit (incoming transformer, cooling unit ...) has detected an illegal state. Determine the exact cause of the fault and check the relevant device.	9013	19	29	26	15

1. Undervoltage condition of the electronics power supply
2. Overvoltage condition of the electronics power supply

**Drive object:**

Each message (fault/alarm) specifies the control mode (CU-variant) in which it can be found. A message can belong to one, several, or all CU -variants.

**Reaction: Default fault reaction (adjustable fault reaction)**

Specifies the default reaction in the event of a fault.

The optional parentheses indicate whether the default fault reactions can be changed and which fault reactions can be adjusted via parameters (p2100, p2101).

---

**Note**

See Table "Fault reactions" (Page 977)

---

**Acknowledgment: Default acknowledgment (adjustable acknowledgment)**

Specifies the default method of acknowledging faults after the cause has been eliminated.

The optional parentheses indicate whether the default acknowledgment can be changed and which acknowledgment can be adjusted via parameters (p2126, p2127).

---

**Note**

See Table "Acknowledging faults" (Page 979)

---

**Cause:**

Describes the possible causes of the fault or alarm. A fault or alarm value can also be specified (optional).

Fault value (r0949, format):

The fault value is entered in the fault buffer in r0949[0...63] and specifies additional, more precise information about a fault.

Alarm value (r2124, format):

The alarm value specifies additional, more precise information about an alarm.

The alarm value is entered in the alarm buffer in r2124[0...63] and specifies additional, more precise information about an alarm.

**Remedy:**

Describes the methods available for eliminating the cause of the active fault or alarm.

**WARNING**

On a case for case basis, service and maintenance personnel are responsible for choosing a suitable method for eliminating the cause of faults.

### 4.1.3 Number ranges of faults and alarms

---

**Note**

The following number ranges represent an overview of all faults and alarms used in the SINAMICS drive family.

The faults and alarms for the product described in this List Manual are described in detail in "List of faults and alarms" (Page 988).

---

Faults and alarms are organized into the following number ranges:

**F01003 Acknowledgment delay when accessing the memory**

**Message class:** Hardware/software error (1)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** A memory area was accessed that does not return a "READY".  
Fault value (r0949, interpret hexadecimal):  
Only for internal Siemens troubleshooting.  
**Remedy:** - carry out a POWER ON (switch-off/switch-on) for all components.  
- contact Technical Support.

---

**N01004 (F, A) Internal software error**

**Message class:** Hardware/software error (1)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** An internal software error has occurred.  
Fault value (r0949, hexadecimal):  
Only for internal Siemens troubleshooting.  
**Remedy:** - read out diagnostics parameter (r9999).  
- contact Technical Support.

---

**F01005 File upload/download error**

**Message class:** Hardware/software error (1)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** The upload or download of EEPROM data was unsuccessful.  
Fault value (r0949, interpret hexadecimal):  
yyxxxx hex: yy = component number, xxxx = fault cause  
xxxx = 000B hex = 11 dec:  
Power unit component has detected a checksum error.  
xxxx = 000F hex = 15 dec:  
The selected power unit will not accept the content of the EEPROM file.  
xxxx = 0011 hex = 17 dec:  
Power unit component has detected an internal access error.  
xxxx = 0012 hex = 18 dec:  
After several communication attempts, no response from the power unit component.  
xxxx = 008B hex = 140 dec:  
EEPROM file for the power unit component not available on the memory card.  
xxxx = 008D hex = 141 dec:  
An inconsistent length of the firmware file was signaled. It is possible that the download/upload has been interrupted.  
xxxx = 0090 hex = 144 dec:  
When checking the file that was loaded, the component detected a fault (checksum). It is possible that the file on the memory card is defective.  
xxxx = 0092 hex = 146 dec:  
This SW or HW does not support the selected function.  
xxxx = 009C hex = 156 dec:  
Component with the specified component number is not available (p7828).  
xxxx = Additional values:  
Only for internal Siemens troubleshooting.  
**Remedy:** Save a suitable firmware file or EEPROM file for upload or download in folder "/ee\_sac/" on the memory card.

<b>A01006</b>	<b>Firmware update for DRIVE-CLiQ component required</b>
<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The firmware of a DRIVE-CLiQ component must be updated as there is no suitable firmware or firmware version in the component for operation with the Control Unit. Alarm value (r2124, interpret decimal): Component number of the DRIVE-CLiQ component.
<b>Remedy:</b>	Firmware update using the commissioning software: The firmware version of all of the components on the "Version overview" page can be read in the Project Navigator under "Configuration" of the associated drive unit and an appropriate firmware update can be carried out. Firmware update via parameter: - take the component number from the alarm value and enter into p7828. - start the firmware download with p7829 = 1.
<b>A01007</b>	<b>POWER ON for DRIVE-CLiQ component required</b>
<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	A DRIVE-CLiQ component must be switched on again (POWER ON) (e.g. due to a firmware update). Alarm value (r2124, interpret decimal): Component number of the DRIVE-CLiQ component. Note: For a component number = 1, a POWER ON of the Control Unit is required.
<b>Remedy:</b>	- Switch off the power supply of the specified DRIVE-CLiQ component and switch it on again. - For SINUMERIK, auto commissioning is prevented. In this case, a POWER ON is required for all components and the auto commissioning must be restarted.
<b>A01009 (N)</b>	<b>CU: Control module overtemperature</b>
<b>Message class:</b>	Overtemperature of the electronic components (6)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The temperature (r0037[0]) of the control module (Control Unit) has exceeded the specified limit value.
<b>Remedy:</b>	- check the air intake for the Control Unit. - check the Control Unit fan. Note: The alarm is automatically withdrawn once the limit value has been fallen below.
<b>F01010</b>	<b>Drive type unknown</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	An unknown drive type was found.
<b>Remedy:</b>	- replace Power Module. - carry out a POWER ON (switch-off/switch-on). - upgrade firmware to later version. - contact Technical Support.

---

**F01015 Internal software error**

**Message class:** Hardware/software error (1)  
**Reaction:** OFF2  
**Acknowledge:** POWER ON  
**Cause:** An internal software error has occurred.  
Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.  
**Remedy:** - carry out a POWER ON (switch-off/switch-on) for all components.  
- upgrade firmware to later version.  
- contact Technical Support.

---

**A01016 (F) Firmware changed**

**Message class:** Hardware/software error (1)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** At least one firmware file in the directory was illegally changed on the non-volatile memory (memory card/device memory) with respect to the version when shipped from the factory.  
Alarm value (r2124, interpret decimal):  
0: Checksum of one file is incorrect.  
1: File missing.  
2: Too many files.  
3: Incorrect firmware version.  
4: Incorrect checksum of the back-up file.  
**Remedy:** For the non-volatile memory for the firmware (memory card/device memory), restore the delivery condition.  
Note:  
The file involved can be read out using parameter r9925.  
The status of the firmware check is displayed using r9926.  
See also: r9925 (Firmware file incorrect), r9926 (Firmware check status)

---

**A01017 Component lists changed**

**Message class:** Hardware/software error (1)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** On the memory card, one file in the directory /SIEMENS/SINAMICS/DATA or /ADDON/SINAMICS/DATA has been illegally changed with respect to that supplied from the factory. No changes are permitted in this directory.  
Alarm value (r2124, interpret decimal):  
zyx dec: x = Problem, y = Directory, z = File name  
x = 1: File does not exist.  
x = 2: Firmware version of the file does not match the software version.  
x = 3: File checksum is incorrect.  
y = 0: Directory /SIEMENS/SINAMICS/DATA/  
y = 1: Directory /ADDON/SINAMICS/DATA/  
z = 0: File MOTARM.ACX  
z = 1: File MOTSRM.ACX  
z = 2: File MOTSLM.ACX  
z = 3: File ENCDATA.ACX  
z = 4: File FILTDATA.ACX  
z = 5: File BRKDATA.ACX  
z = 6: File DAT\_BEAR.ACX  
z = 7: File CFG\_BEAR.ACX  
**Remedy:** For the file on the memory card involved, restore the status originally supplied from the factory.

#### **F01018 Booting has been interrupted several times**

**Message class:** Hardware/software error (1)

**Reaction:** NONE

**Acknowledge:** POWER ON

**Cause:** Module booting was interrupted several times. As a consequence, the module boots with the factory setting.

Possible reasons for booting being interrupted:

- power supply interrupted.
- CPU crashed.
- parameterization invalid.

**Remedy:** - carry out a POWER ON (switch-off/switch-on). After switching on, the module reboots from the valid parameterization (if available).

- restore the valid parameterization.

Examples:

a) Carry out a first commissioning, save, carry out a POWER ON (switch-off/switch-on).

b) Load another valid parameter backup (e.g. from the memory card), save, carry out a POWER ON (switch-off/switch-on).

Note:

If the fault situation is repeated, then this fault is again output after several interrupted boots.

---

#### **A01019 Writing to the removable data medium unsuccessful**

**Message class:** Hardware/software error (1)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The write access to the removable data medium was unsuccessful.

**Remedy:** Remove and check the removable data medium. Then run the data backup again.

---

#### **A01020 Writing to RAM disk unsuccessful**

**Message class:** Hardware/software error (1)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A write access to the internal RAM disk was unsuccessful.

**Remedy:** Adapt the file size for the system logbook to the internal RAM disk (p9930).

See also: p9930 (System logbook activation)

---

#### **A01021 Removable data medium as USB data storage medium from the PC used**

**Message class:** General drive fault (19)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The removable data medium is used as USB data storage medium from a PC

As a consequence, the drive cannot access the removable data medium. When backing up, the configuration data cannot be saved on the removable data medium.

Alarm value (r2124, interpret decimal):

1: The know-how protection as well as the copy protection for the removable data medium is active. Backup is inhibited.

2: The configuration data are only backed up in the Control Unit.

See also: r7760 (Write protection/know-how protection status), r9401 (Safely remove memory card status)

**Remedy:** De-activate the USB connection to the PC and back up the configuration data.

Note:

The alarm is automatically canceled when disconnecting the USB connection or when removing the removable data medium.

See also: r9401 (Safely remove memory card status)

**F01023 Software timeout (internal)**

**Message class:** Hardware/software error (1)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** An internal software timeout has occurred.  
Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.  
**Remedy:** - carry out a POWER ON (switch-off/switch-on) for all components.  
- upgrade firmware to later version.  
- contact Technical Support.

---

**A01028 (F) Configuration error**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The parameterization that was downloaded was generated with a different module type (Order No., MLFB).  
**Remedy:** Save parameters in a non-volatile fashion (p0971 = 1).

---

**F01030 Sign-of-life failure for master control**

**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)  
**Acknowledge:** IMMEDIATELY  
**Cause:** For active PC master control, no sign-of-life was received within the monitoring time.  
The master control was returned to the active BICO interconnection.  
**Remedy:** Set the monitoring time higher at the PC or, if required, completely disable the monitoring function.  
For the commissioning software, the monitoring time is set as follows:  
<Drive> -> Commissioning -> Control panel -> Button "Fetch master control" -> A window is displayed to set the monitoring time in milliseconds.  
Notice:  
The monitoring time should be set as short as possible. A long monitoring time means a late response when the communication fails!

**F01033 Units changeover: Reference parameter value invalid**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** When changing over the units to the referred representation type, it is not permissible for any of the required reference parameters to be equal to 0.0  
Fault value (r0949, parameter):  
Reference parameter whose value is 0.0.  
See also: p0505 (Selecting the system of units), p0595 (Technological unit selection)  
**Remedy:** Set the value of the reference parameter to a number different than 0.0.  
See also: p0304, p0305, p0310, p0596, p2000, p2001, p2002, p2003, r2004

---

**F01034**      **Units changeover: Calculation parameter values after reference value change unsuccessful**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** The change of a reference parameter meant that for an involved parameter the selected value was not able to be re-calculated in the per unit representation. The change was rejected and the original parameter value restored.  
 Fault value (r0949, parameter):  
 Parameter whose value was not able to be re-calculated.  
 See also: p0304, p0305, p0310, p0596, p2000, p2001, p2002, p2003, r2004

**Remedy:**

- Select the value of the reference parameter such that the parameter involved can be calculated in the per unit representation.
- Technology unit selection (p0595) before changing the reference parameter p0596, set p0595 = 1.

**A01035 (F)**      **ACX: Parameter back-up file corrupted**

**Message class:** Hardware/software error (1)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** When the Control Unit is booted, no complete data set was found from the parameter back-up files. The last time that the parameterization was saved, it was not completely carried out.  
 It is possible that the backup was interrupted by switching off or withdrawing the memory card.  
 Alarm value (r2124, interpret hexadecimal):  
 ddcbbbaa hex:  
 aa = 01 hex:  
 Power up was realized without data backup. The drive is in the factory setting.  
 aa = 02 hex:  
 The last available internal backup data record was loaded. The parameterization must be checked. It is recommended that the parameterization is downloaded again.  
 aa = 03 hex:  
 The last available data record from the memory card was loaded. The parameterization must be checked.  
 aa = 04 hex:  
 An invalid data backup was loaded from the memory card into the drive. The drive is in the factory setting.  
 dd, cc, bb:  
 Only for internal Siemens troubleshooting.  
 See also: p0971 (Save parameters)

**Remedy:**

- Download the project again with the commissioning software.
- save all parameters (p0971 = 1 or "copy RAM to ROM").

---

**F01036 (A)**      **ACX: Parameter back-up file missing**

**Message class:** Hardware/software error (1)

**Reaction:** NONE (OFF1, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** When downloading the device parameterization, a parameter back-up file PSxxxxyy.ACX associated with a drive object cannot be found.  
 Fault value (r0949, interpret hexadecimal):  
 Byte 1: yyy in the file name PSxxxxyy.ACX  
 yyy = 000 --> consistency back-up file  
 yyy = 001 ... 062 --> drive object number  
 yyy = 099 --> PROFIBUS parameter back-up file  
 Byte 2, 3, 4:  
 Only for internal Siemens troubleshooting.

**Remedy:**

If you have saved the project data using the commissioning software, carry out a new download for your project. Save using the function "Copy RAM to ROM" or with p0971 = 1.  
 This means that the parameter files are again completely written into the non-volatile memory.  
 Note:  
 If the project data have not been backed up, then a new first commissioning is required.

Byte 2:  
255: Incorrect drive object type.  
254: Topology comparison unsuccessful -> drive object type was not able to be identified.  
Reasons could be:  
- incorrect component type in the actual topology  
- Component does not exist in the actual topology.  
- Component not active.  
Additional values:  
Only for internal Siemens troubleshooting.  
Byte 4, 3:  
Only for internal Siemens troubleshooting.  
**Remedy:** - if you have saved the project data using the commissioning software, download the project again. Save using the function "Copy RAM to ROM" or with p0971 = 1. This means that the parameter files are again completely written to the non-volatile memory.  
- replace the memory card or Control Unit.

---

**F01039 (A) ACX: Writing to the parameter back-up file was unsuccessful**

**Message class:** Hardware/software error (1)  
**Reaction:** NONE (OFF1, OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** Writing to at least one parameter back-up file PSxxxxyy.\*\* in the non-volatile memory was unsuccessful.  
- in the directory /USER/SINAMICS/DATA/ at least one parameter back-up file PSxxxxyy.\*\* has the "read only" file attribute and cannot be overwritten.  
- there is not sufficient free memory space available.  
- the non-volatile memory is defective and cannot be written to.  
Fault value (r0949, interpret hexadecimal):  
dcba hex  
a = yyy in the file names PSxxxxyy.\*\*

b = 012 --> data save started with p0971 = 12  
d, c:  
Only for internal Siemens troubleshooting.  
**Remedy:** - check the file attribute of the files (PSxxxxyy.\*\*, CAxxxxyy.\*\*, CCxxxxyy.\*\*\*) and, if required, change from "read only" to "writeable".  
- check the free memory space in the non-volatile memory. Approx. 80 kbyte of free memory space is required for every drive object in the system.  
- replace the memory card or Control Unit.

<b>F01040</b>	<b>Save parameter settings and carry out a POWER ON</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	POWER ON
<b>Cause:</b>	A parameter has been changed that requires the parameters to be backed up and the Control Unit to be switched OFF and ON again.
<b>Remedy:</b>	- Save parameters (p0971). - carry out a POWER ON (switch-off/switch-on) for the Control Unit.

---

<b>F01042</b>	<b>Parameter error during project download</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF2 (NONE, OFF1, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	An error was detected when downloading a project using the commissioning software (e.g. incorrect parameter value). For the specified parameter, it was detected that dynamic limits were exceeded that may possibly depend on other parameters. Fault value (r0949, interpret hexadecimal): ccbbaaaa hex aaaa = Parameter bb = Index cc = fault cause 0: Parameter number illegal. 1: Parameter value cannot be changed. 2: Lower or upper value limit exceeded. 3: Sub-index incorrect. 4: No array, no sub-index. 5: Data type incorrect. 6: Setting not permitted (only resetting). 7: Descriptive element cannot be changed. 9: Descriptive data not available. 11: No master control. 15: No text array available. 17: Task cannot be executed due to operating state. 20: Illegal value. 21: Response too long. 22: Parameter address illegal. 23: Format illegal. 24: Number of values not consistent. 108: Unit unknown. Additional values: Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- enter the correct value in the specified parameter. - identify the parameter that restricts the limits of the specified parameter.

<b>F01043</b>	<b>Fatal error at project download</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF2 (OFF1, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A fatal error was detected when downloading a project using the commissioning software. Fault value (r0949, interpret decimal): 1: Device status cannot be changed to Device Download (drive object ON?). 2: Incorrect drive object number. 8: Maximum number of drive objects that can be generated exceeded. 11: Error while generating a drive object (global component).

- 12: Error while generating a drive object (drive component).
- 13: Unknown drive object type.
- 14: Drive status cannot be changed to "ready for operation" (r0947 and r0949).
- 15: Drive status cannot be changed to drive download.
- 16: Device status cannot be changed to "ready for operation".
- 18: A new download is only possible if the factory settings are restored for the drive unit.
- 20: The configuration is inconsistent.
- 21: Error when accepting the download parameters.
- 22: SW-internal download error.
- 100: The download was canceled, because no write requests were received from the commissioning client (e.g. for communication error).

Additional values:

Only for internal Siemens troubleshooting.

- Remedy:**
- use the current version of the commissioning software.
  - modify the offline project and download again (e.g. compare the motor and Power Module in the offline project and on the drive).
  - change the drive state (is a drive rotating or is there a message/signal?).
  - carefully note any other messages/signals and remove their cause.
  - boot from previously saved files (switch-off/switch-on or p0970).

**F01044 CU: Descriptive data error**

- Message class:** Hardware/software error (1)  
**Reaction:** OFF2  
**Acknowledge:** POWER ON  
**Cause:** An error was detected when loading the descriptive data saved in the non-volatile memory.  
**Remedy:** Replace the memory card or Control Unit.

**A01045 Configuring data invalid**

- Message class:** Hardware/software error (1)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** An error was detected when evaluating the parameter files PSxxxxxyy.ACX, PTxxxxyy.ACX, CAxxxxyy.ACX, or CCxxxxyy.ACX saved in the non-volatile memory. Because of this, under certain circumstances, several of the saved parameter values were not able to be accepted. Also see r9406 up to r9408.  
 Alarm value (r2124, interpret hexadecimal):  
 Only for internal Siemens troubleshooting.
- Remedy:**
- check the parameters displayed in r9406 up to r9408, and correct these if required.
  - Restore the factory setting using (p0970 = 1) and re-load the project into the drive unit.
- Then save the parameterization in STARTER using the function "Copy RAM to ROM" or with p0971 = 1. This overwrites the incorrect parameter files in the non-volatile memory – and the alarm is withdrawn.  
 See also: r9406 (PS file parameter number parameter not transferred), r9407 (PS file parameter index parameter not transferred), r9408 (PS file fault code parameter not transferred)

**A01049 It is not possible to write to file**

- Message class:** Hardware/software error (1)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** It is not possible to write into a write-protected file (PSxxxxxx.acx). The write request was interrupted.  
 Alarm value (r2124, interpret decimal):  
 Drive object number.
- Remedy:** Check whether the "write protected" attribute has been set for the files in the non-volatile memory under .../USER/SINAMICS/DATA/... When required, remove write protection and save again (e.g. set p0971 to 1).

<b>F01054</b>	<b>CU: System limit exceeded</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A system overload was identified as a result of too many functions requiring a lot of computation time. At least one of the following rules was not complied with: - it is not permissible to activate function module "Position control" (r0108.3) in conjunction with "Free function blocks" (r0108.18). - it is not permissible to activate function module "Basic positioner" (r0108.4) in conjunction with "Free function blocks" (r0108.18). - when the function module "Free function blocks" is activated (r0108.18), only 1 speed encoder must be operated.
<b>Remedy:</b>	Configure the drive device corresponding to the rules listed under cause.

---

<b>A01064 (F)</b>	<b>CU: Internal error (CRC)</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	A checksum error (CRC error) has occurred in the Control Unit program memory
<b>Remedy:</b>	- carry out a POWER ON (switch-off/switch-on) for all components. - upgrade firmware to later version. - contact Technical Support.

---

<b>A01066</b>	<b>Buffer memory: 70% fill level reached or exceeded</b>
<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The non-volatile buffer memory for parameter changes is filled to at least 70%. This can also occur if the buffer memory is active (p0014 = 1) and parameters are continually changed via a fieldbus system.
<b>Remedy:</b>	If required, de-activate and clear the buffer memory (p0014 = 0). If required, clear the buffer memory (p0014 = 2). In the following cases, the entries in the buffer memory are transferred into the ROM and then the buffer memory is cleared: - p0971 = 1 - switch off/switch on the Control Unit See also: p0014 (Buffer memory mode)

---

<b>A01067</b>	<b>Buffer memory: 100 % fill level reached</b>
<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The non-volatile buffer memory for parameter changes is filled to 100%. All additional parameter changes will no longer be taken into account in the non-volatile buffer memory. However, parameter changes can still be made in the volatile memory (RAM). This can also occur if the buffer memory is active (p0014 = 1) and parameters are continually changed via a fieldbus system.
<b>Remedy:</b>	If required, de-activate and clear the buffer memory (p0014 = 0). If required, clear the buffer memory (p0014 = 2). In the following cases, the entries in the buffer memory are transferred into the ROM and then the buffer memory is cleared: - p0971 = 1 - switch off/switch on the Control Unit See also: p0014 (Buffer memory mode)

<b>F01068</b>	<b>CU: Data memory memory overflow</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The utilization for a data memory area is too large. Fault value (r0949, interpret binary): Bit 0 = 1: High-speed data memory 1 overloaded Bit 1 = 1: High-speed data memory 2 overloaded Bit 2 = 1: High-speed data memory 3 overloaded Bit 3 = 1: High-speed data memory 4 overloaded
<b>Remedy:</b>	- de-activate the function module. - de-activate drive object. - remove the drive object from the target topology.

---

<b>A01069</b>	<b>Parameter backup and device incompatible</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The parameter backup (on the memory card or in the drive unit) and the drive device do not match. The module boots with the factory settings. Example: Devices A and B. are not compatible and a memory card with the parameter backup for device A is inserted in device B.
<b>Remedy:</b>	- insert a memory card with compatible parameter backup and carry out a POWER ON. - insert a memory card without parameter backup and carry out a POWER ON. - if required, withdraw the memory card and carry out POWER ON. - carry out a hardware reset (p0972 = 1). - save the parameters (p0971 = 1).

---

<b>F01072</b>	<b>Memory card restored from the backup copy</b>
<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The Control Unit was switched-off while writing to the memory card. This is why the visible partition became defective. After switching on, the data from the non-visible partition (backup copy) were written to the visible partition.
<b>Remedy:</b>	Check that the firmware and parameterization is up-to-date.

---

<b>A01073 (N)</b>	<b>POWER ON required for backup copy on memory card</b>
<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The parameter assignment on the visible partition of the memory card has changed. In order that the backup copy on the memory card is updated on the non-visible partition, it is necessary to carry out a POWER ON or hardware reset (p0972) of the Control Unit. Note: It is possible that a new POWER ON is requested via this alarm (e.g. after saving with p0971 = 1).
<b>Remedy:</b>	- carry out a POWER ON (switch-off/switch-on) for the Control Unit. - carry out a hardware reset (RESET button, p0972).

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

<b>F01105 (A)</b>	<b>CU: Insufficient memory</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF1
<b>Acknowledge:</b>	POWER ON
<b>Cause:</b>	Too many data sets are configured on this Control Unit. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- reduce the number of data sets.

---

<b>F01107</b>	<b>Save to memory card unsuccessful</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A data save to the memory card was not able to be successfully carried out. - Memory card is defective. - insufficient space on memory card. Fault value (r0949, interpret decimal): 1: The file on the RAM was not able to be opened. 2: The file on the RAM was not able to be read. 3: A new directory could not be created on the memory card. 4: A new file could not be created on the memory card. 5: A new file could not be written on the memory card.
<b>Remedy:</b>	- try to save again. - replace the memory card or Control Unit.

---

<b>F01110</b>	<b>CU: More than one SINAMICS G on one Control Unit</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	More than one SINAMICS G type power unit is being operated from the Control Unit. Fault value (r0949, interpret decimal): Number of the second drive with a SINAMICS G type power unit.
<b>Remedy:</b>	Only one SINAMICS G drive type is permitted.

---

<b>F01111</b>	<b>CU: Mixed operation of drive units illegal</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	Illegal operation of various drive units on one Control Unit: - SINAMICS S together with SINAMICS G - SINAMICS S together with SINAMICS S Value or Combi Fault value (r0949, interpret decimal): Number of the first drive object with a different power unit type.
<b>Remedy:</b>	Only power units of one particular drive type may be operated with one Control Unit.

---

<b>F01112</b>	<b>CU: Power unit not permissible</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The connected power unit cannot be used together with this Control Unit. Fault value (r0949, interpret decimal): 1: Power unit is not supported (e.g. PM340).
<b>Remedy:</b>	Replace the power unit that is not permissible by a component that is permissible.

---

---

<b>F01120 (A)</b>	<b>Terminal initialization has failed</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	OFF1 (OFF2)
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	An internal software error occurred while the terminal functions were being initialized. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- carry out a POWER ON (switch-off/switch-on) for all components. - upgrade firmware to later version. - contact Technical Support. - replace the Control Unit.

---

<b>F01122 (A)</b>	<b>Frequency at the measuring probe input too high</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF1 (OFF2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The frequency of the pulses at the measuring probe input is too high. Fault value (r0949, interpret decimal): 1: DI/DO 9 (X122.8) 2: DI/DO 10 (X122.10) 4: DI/DO 11 (X122.11) 8: DI/DO 13 (X132.8) 16: DI/DO 14 (X132.10) 32: DI/DO 15 (X132.11) 64: DI/DO 8 (X122.7) 128: DI/DO 12 (X132.7)
<b>Remedy:</b>	Reduce the frequency of the pulses at the measuring probe input.

---

<b>F01150</b>	<b>CU: Number of instances of a drive object type exceeded</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The maximum permissible number of instances of a drive object type was exceeded. Drive object type: Drive object type (p0107), for which the maximum permissible number of instances was exceeded. Number permitted: Max. permissible number of instances for this drive object type. Actual number: Current number of instances for this drive object type. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): ddccbbaa hex: aa = drive object type, bb = number limited, cc = actual number, dd = no significance
<b>Remedy:</b>	- switch off the unit. - suitably restrict the number of instances of a drive object type by reducing the number of inserted components. - re-commission the unit.

---

**F01151**      **CU: Number of drive objects of a category exceeded**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** The maximum permissible number of drive objects of a category was exceeded.  
Drive object category:  
Drive object category, for which the maximum permissible number of drive objects was exceeded.  
Number permitted:  
Max. permissible number for this drive object category.  
Actual number:  
Actual number for this drive object category.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
ddccbbaa hex: aa = drive object category, bb = number limited, cc = actual number, dd = no significance

**Remedy:**

- switch off the unit.
- suitably restrict the number of drive objects of the specified category by reducing the number of inserted components.
- re-commission the unit.

**F01205**      **CU: Time slice overflow**

**Message class:** Hardware/software error (1)

**Reaction:** OFF2

**Acknowledge:** POWER ON

**Cause:** Insufficient computation time.  
Fault value (r0949, interpret hexadecimal):  
Only for internal Siemens troubleshooting.

**Remedy:** Contact Technical Support.

---

**F01221**      **CU: Bas clk cyc too low**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** The closed-loop control / monitoring cannot maintain the envisaged clock cycle.  
The runtime of the closed-loop control/monitoring is too long for the particular clock cycle or the computing time remaining in the system is not sufficient for the closed-loop control/monitoring.  
Fault value (r0949, interpret hexadecimal):  
Only for internal Siemens troubleshooting.

**Remedy:** Increase the basic clock cycle of DRIVE-CLiQ communication.

---

**F01250**      **CU: CU-EEPROM incorrect read-only data**

**Message class:** Hardware/software error (1)

**Reaction:** NONE (OFF2)

**Acknowledge:** POWER ON

**Cause:** Error when reading the read-only data of the EEPROM in the Control Unit.  
Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.

**Remedy:**

- carry out a POWER ON.
- replace the Control Unit.

<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The non-volatile memory has a more recent firmware version than the one in the connected DRIVE-CLiQ component. Alarm value (r2124, interpret decimal): Component number of the DRIVE-CLiQ component involved.
<b>Remedy:</b>	Update the firmware (p7828, p7829 and commissioning software).
<hr/>	
<b>A01306</b>	<b>Firmware of the DRIVE-CLiQ component being updated</b>
<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	Firmware update is active for at least one DRIVE-CLiQ component. Alarm value (r2124, interpret decimal): Component number of the DRIVE-CLiQ component.
<b>Remedy:</b>	Not necessary. This alarm automatically disappears after the firmware has been updated.

<b>A01314</b>	<b>Topology: Component must not be present</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	For a component, "de-activate and not present" is set but this component is still in the topology. Alarm value (r2124, interpret hexadecimal): ddccbbaa hex: aa = component number bb = component class of the component cc = connection number Note: Component class and connection number are described in F01375.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

**Remedy:**

- remove the corresponding component.
- change the setting "de-activate and not present".

**Note:**  
Under "Topology --> Topology view" the commissioning software where relevant offers improved diagnostics capability (e.g. setpoint/actual value comparison).

---

#### **A01315 Drive object not ready for operation**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** For the active drive object involved, at least one activated component is missing.  
**Note:**  
All other active and operational drive objects can be in the "RUN" state.  
**Remedy:** The alarm automatically disappears after the following action has been taken:  
Re-insert the component involved.

---

#### **A01316 Drive object inactive and again ready for operation**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** If, when inserting a component of the target topology, an inactive, non-operational drive object becomes operational again.  
**Note:**  
This is the only message that is displayed for a de-activated drive object.  
**Remedy:** The alarm automatically disappears after the following action has been taken:  
Again withdraw the component involved.

---

#### **A01317 (N) De-activated component again present**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** If a component of the target topology is inserted when a drive object is active.  
**Note:**  
This is the only message that is displayed for a de-activated component.  
**Remedy:** The alarm automatically disappears after the following action has been taken:  
Again withdraw the component involved.

---

#### **A01318 BICO: De-activated interconnections present**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** This alarm is used in the following cases:  
- if an inactive/non-operational drive object is active again/ready for operation  
- if there are items in the list of BI/CI parameters (r9498[0...29], r9499[0...29])  
- if the BICO interconnections saved in the list of BI/CI parameters (r9498[0...29], r9499[0...29]) have actually been changed  
**Remedy:** Reset alarm:  
- set p9496 to 1 or 2  
or  
- de-activate the drive object again.

---

<b>A01319</b>	<b>Inserted component not initialized</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	Initialization is required for at least one inserted component. This is only possible if the pulses are inhibited for all the drive objects.
<b>Remedy:</b>	Activate pulse inhibit for all drive objects.

<b>F01340</b>	<b>Topology: Too many components on one line</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	<p>For the selected communications clock cycle, too many DRIVE-CLiQ components are connected to one line of the Control Unit.</p> <p>Fault value (r0949, interpret hexadecimal): xyy hex: x = fault cause, yy = component number or connection number.</p> <p>1yy: The communications clock cycle of the DRIVE-CLiQ connection on the Control Unit is not sufficient for all read transfers.</p> <p>2yy: The communications clock cycle of the DRIVE-CLiQ connection on the Control Unit is not sufficient for all write transfers.</p> <p>3yy: Cyclic communication is fully utilized.</p> <p>4yy: The DRIVE-CLiQ cycle starts before the earliest end of the application. An additional dead time must be added to the control. Sign-of-life errors can be expected. The conditions of operation with a current controller sampling time of 31.25 µs have not been maintained.</p> <p>5yy: Internal buffer overflow for net data of a DRIVE-CLiQ connection.</p> <p>6yy: Internal buffer overflow for receive data of a DRIVE-CLiQ connection.</p> <p>7yy: Internal buffer overflow for send data of a DRIVE-CLiQ connection.</p> <p>8yy: The component clock cycles cannot be combined with one another</p> <p>900: The lowest common multiple of the clock cycles in the system is too high to be determined.</p> <p>901: The lowest common multiple of the clock cycles in the system cannot be generated with the hardware.</p>
<b>Remedy:</b>	<p>- check the DRIVE-CLiQ wiring.</p> <p>- reduce the number of components on the DRIVE-CLiQ line involved and distribute these to other DRIVE-CLiQ sockets of the Control Unit. This means that communication is uniformly distributed over several lines.</p> <p>For fault value = 1yy - 4yy in addition:</p> <p>- increase the sampling times (p0112, p0115, p4099). If necessary, for DCC or FBLOCKS, change the assignment of the run-time group (p21000, p20000) so that the sampling time (r21001, r20001) is increased.</p> <p>- if necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).</p> <p>- reduce the function modules (r0108).</p> <p>- establish the conditions for operation with a current controller sampling time of 31.25 µs (at the DRIVE-CLiQ line, only operate Motor Modules and Sensor Modules with this sampling time and only use a permitted Sensor Module (e.g. SMC20, this means a 3 at the last position of the order number)).</p> <p>- For an NX, the corresponding Sensor Module for a possibly existing second measuring system should be connected to a free DRIVE-CLiQ socket of the NX.</p> <p>For fault value = 8yy in addition:</p> <p>- check the clock cycles settings (p0112, p0115, p4099). Clock cycles on a DRIVE-CLiQ line must be perfect integer multiples of one another. As clock cycle on a line, all clock cycles of all drive objects in the previously mentioned parameters apply, which have components on the line involved.</p> <p>For fault value = 9yy in addition:</p> <p>- check the clock cycles settings (p0112, p0115, p4099). The lower the numerical value difference between two clock cycles, the higher the lowest common multiple. This behavior has a significantly stronger influence, the higher the numerical values of the clock cycles.</p>

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

<b>F01505 (A)</b>	<b>BICO: Interconnection cannot be established</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A PROFIdrive telegram has been set (p0922). An interconnection contained in the telegram was not able to be established. Fault value (r0949, interpret decimal): Parameter receiver that should be changed.
<b>Remedy:</b>	Establish another interconnection.

---

<b>A01507 (F, N)</b>	<b>BICO: Interconnections to inactive objects present</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	There are BICO interconnections to an inactive/inoperable drive object. The BI/CI parameters involved are listed in r9498. The associated BO/CO parameters are listed in r9499. The list of the BICO interconnections to other drive objects is displayed in r9491 and r9492 of the de-activated drive object. Note: r9498 and r9499 are only written to, if p9495 is not set to 0. Alarm value (r2124, interpret decimal): Number of BICO interconnections found to inactive drive objects.
<b>Remedy:</b>	- set all open BICO interconnections centrally to the factory setting with p9495 = 2. - make the non-operational drive object active/operational again (re-insert or activate components).

---

<b>A01508</b>	<b>BICO: Interconnections to inactive objects exceeded</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The maximum number of BICO interconnections (signal sinks) when de-activating a drive object was exceeded. When de-activating a drive object, all BICO interconnections (signal sinks) are listed in the following parameters: - r9498[0...29]: List of the BI/CI parameters involved. - r9499[0...29]: List of the associated BO/CO parameters.
<b>Remedy:</b>	The alarm automatically disappears as soon as no BICO interconnection (value = 0) is entered in r9498[29] and r9499[29]. Notice: When re-activating the drive object, all BICO interconnections should be checked and if required, re-established.

---

<b>F01510</b>	<b>BICO: Signal source is not float type</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The requested connector output does not have the correct data type. This interconnection is not established. Fault value (r0949, interpret decimal): Parameter number to which an interconnection should be made (connector output).
<b>Remedy:</b>	Interconnect this connector input with a connector output having a float data type.

---

<b>F01511 (A)</b>	<b>BICO: Interconnection with different scalings</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values. - the BICO output has different normalized units than the BICO input. - message only for interconnections within a drive object.

Example:

The BICO output has, as normalized unit, voltage and the BICO input has current.

This means that the factor p2002/p2001 is calculated between the BICO output and the BICO input.

p2002: contains the reference value for current

p2001: contains the reference value for voltage

Fault value (r0949, interpret decimal):

Parameter number of the BICO input (signal sink).

**Remedy:** Not necessary.

### **F01512 BICO: No scaling available**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** OFF2

**Acknowledge:** POWER ON

**Cause:** An attempt was made to determine a conversion factor for a scaling that does not exist.

Fault value (r0949, interpret decimal):

Unit (e.g. corresponding to SPEED) for which an attempt was made to determine a factor.

**Remedy:** Apply scaling or check the transfer value.

### **F01513 (N, A) BICO: Interconnection cross DO with different scalings**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values.

An interconnection is made between different drive objects and the BICO output has different normalized units than the BICO input or the normalized units are the same but the reference values are different.

Example 1:

BICO output with voltage normalized unit, BICO input with current normalized unit, BICO output and BICO input lie in different drive objects. This means that the factor p2002/p2001 is calculated between the BICO output and the BICO input.

p2002: contains the reference value for current

p2001: contains the reference value for voltage

Example 2:

BICO output with voltage normalized unit in drive object 1 (DO1), BICO input with voltage normalized unit in drive object 2 (DO2). The reference values for voltage (p2001) of the two drive objects have different values. This means that the factor p2001(DO1)/p2001(DO2) is calculated between the BICO output and the BICO input.

p2001: contains the reference value for voltage, drive objects 1, 2

Fault value (r0949, interpret decimal):

Parameter number of the BICO input (signal sink).

**Remedy:** Not necessary.

### **A01514 (F) BICO: Error when writing during a reconnect**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** During a reconnect operation (e.g. while booting or downloading - but can also occur in normal operation) a parameter was not able to be written to.

Example:

When writing to BICO input with double word format (DWORD), in the second index, the memory areas overlap (e.g. p8861). The parameter is then reset to the factory setting.

Alarm value (r2124, interpret decimal):

Parameter number of the BICO input (signal sink).

**Remedy:** Not necessary.

<b>A01590 (F)</b>	<b>Drive: Motor maintenance interval expired</b>
<b>Message class:</b>	General drive fault (19)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The selected service/maintenance interval for this motor was reached. Alarm value (r2124, interpret decimal): Motor data set number. See also: p0650 (Actual motor operating hours), p0651 (Motor operating hours maintenance interval)
<b>Remedy:</b>	carry out service/maintenance and reset the service/maintenance interval (p0651).

<b>F01600</b>	<b>SI P1 (CU): STOP A initiated</b>
<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The drive-integrated "Safety Integrated" function on processor 1 has detected an error and initiated a STOP A. - forced checking procedure (test stop) of the safety switch-off signal path on processor 1 unsuccessful. - subsequent response to fault F01611 (defect in a monitoring channel). Fault value (r0949, interpret decimal): 0: Stop request from processor 2. 1005: - Pulses suppressed although STO not selected and there is no internal STOP A present. - For a Power Module with "STO via terminals at the Power Module" (STO_A/STO_B), these terminals are active (DIP switch to "ON"). However, the "STO via terminals at the Power Module" function has not been enabled (p9601.7 = p9801.7 = 0). 1010: Pulses enabled although STO is selected or an internal STOP A is present. 1011: Internal fault for the pulse enable in the Power Module. 1030: Feedback signal of the safety switch-off signal paths for the "STO via terminals at the Power Module" function different. 9999: Subsequent response to fault F01611.
<b>Remedy:</b>	- select Safe Torque Off and de-select again. - carry out a POWER ON (switch-off/switch-on) for all components. - replace Power Module involved. For fault value = 1005: - de-activate terminals STO_A/STO_B on the Power Module (set both DIP-switches to "OFF") or enable the "STO via terminals at the Power Module" function. For fault value = 1030: - check the discrepancy time, and if required, increase the value (p9650/p9850). - check the STO terminal at the Power Module (contact problems). For fault value = 9999: - carry out diagnostics for fault F01611. Note: PM: Power Module STO: Safe Torque Off

<b>Remedy:</b>	<p>For fault values 1 ... 999 described in "Cause":</p> <ul style="list-style-type: none"><li>- check the cross data comparison that resulted in a STOP F.</li><li>- carry out a POWER ON (switch-off/switch-on).</li></ul> <p>For fault value = 1000:</p> <ul style="list-style-type: none"><li>- check the wiring of the F-DI (contact problems).</li><li>- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.</li><li>- check the discrepancy time, and if required, increase the value (p9650/p9850).</li></ul>

For fault value = 1001, 1002:

- carry out a POWER ON (switch-off/switch-on).

For fault value = 1950, 1951:

- Operate the Control Unit in the permissible temperature range.
- replace Control Unit.

For fault value = 2000, 2001, 2002, 2003:

- check the discrepancy time, and if required, increase the value (p9650/p9850).
- check the wiring of the F-DI (contact problems).
- check the causes of the STO selection in r9772. When the SI Motion functions are active (p9501 = 1), STO can also be selected using these functions.

For fault value = 6000:

- carry out a POWER ON (switch-off/switch-on).
- upgrade firmware to later version.
- contact Technical Support.
- replace Control Unit.

For fault value = 6064:

- check the setting of the value in the F parameter F\_Dest\_Add at the PROFIsafe slave.
- check the setting of the PROFIsafe address on processor 1 (p9610) and on processor 2 (p9810).

For fault value = 6065:

- check the setting of the value in the F parameter F\_Dest\_Add at the PROFIsafe slave. It is not permissible for the destination address to be either 0 or FFFF!

For fault value = 6066:

- check the setting of the value in the F parameter F\_Source\_Add at the PROFIsafe slave. It is not permissible for the source address to be either 0 or FFFF!

For fault value = 6067:

- check the setting of the value in the F parameter F\_WD\_Time at the PROFIsafe slave. It is not permissible for the watch time to be 0!

For fault value = 6068:

- check the setting of the value in the F parameter F\_SIL at the PROFIsafe slave. The SIL level must correspond to SIL2!

For fault value = 6069:

- check the setting of the value in the F parameter F\_CRC\_Length at the PROFIsafe slave. The setting of the CRC2 length is 2-byte CRC in the V1 mode and 3-byte CRC in the V2 mode!

For fault value = 6070:

- check the setting of the value in the F parameter F\_Par\_Version at the PROFIsafe slave. The value for the F parameter version is 0 in the V1 mode and 1 in the V2 mode!

For fault value = 6071:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and, if required, update.

For fault value = 6072:

- check the settings of the values for the F parameters and, if required, correct.

The following combinations are permissible for F parameters F\_CRC\_Length and F\_Par\_Version:

F\_CRC\_Length = 2-byte CRC and F\_Par\_Version = 0

F\_CRC\_Length = 3-byte CRC and F\_Par\_Version = 1

For fault value = 6165:

- if the fault occurs after powering up or after inserting the PROFIBUS/PROFINET cable, acknowledge the fault.
- check the configuration and communication at the PROFIsafe slave.
- check the setting of the value for F parameter F\_WD\_Time on the PROFIsafe slave and increase if necessary.
- check whether all F parameters of the drive match the F parameters of the F host.

For fault value = 6166:

- check the configuration and communication at the PROFIsafe slave.
- check the setting of the value for F parameter F\_WD\_Time on the PROFIsafe slave and increase if necessary.
- evaluate diagnostic information in the F host.
- check PROFIsafe connection.
- check whether all F parameters of the drive match the F parameters of the F host.

For fault values that are described in "Cause":  
- carry out a POWER ON (switch-off/switch-on).  
- contact Technical Support.  
- replace Control Unit.

<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The "Safety Integrated" function integrated in the drive on processor 1 (P1) has detected a brake control error and initiated a STOP A. - motor cable is not shielded correctly. - defect in the Safe Brake Module, in the Power Module or in the Control Unit.

## 4 Faults and alarms

### 4.2 List of faults and alarms

Fault value (r0949, interpret decimal):

10, 11:

Fault in "open holding brake" operation.

- parameter p1278 incorrectly set.
- no brake connected or wire breakage (check whether brake releases for p1278 = 1 and p9602/p9802 = 0 (SBC deactivated)).

- ground fault in brake cable.

20:

Fault in "brake open" state.

- short-circuit in brake winding.

30, 31:

Fault in "close holding brake" operation.

- no brake connected or wire breakage (check whether brake releases for p1278 = 1 and p9602/p9802 = 0 (SBC deactivated)).

- short-circuit in brake winding.

40:

Fault in "brake closed" state.

50:

Fault in the brake control circuit of the Control Unit or communication fault between the Control Unit and Motor Module (brake control).

**Remedy:**

- check parameter p1278 (for SBC, only p1278 = 0 is permissible).
- select Safe Torque Off and de-select again.
- check the motor holding brake connection.
- check the function of the motor holding brake.
- check the Safe Brake Module connection.
- check that the electrical cabinet design and cable routing are in compliance with EMC regulations (e.g. shield of the motor cable and brake conductors are connected with the shield connecting plate and the motor connectors are tightly screwed to the housing).
- replace the Safe Brake Module.
- replace Power Module.
- replace the Control Unit.

Note:

SBC: Safe Brake Control

**A01631 (F, N)**

**SI P1 (CU): motor holding brake/SBC configuration not practical**

**Message class:**

Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:**

NONE

**Acknowledge:**

NONE

**Cause:**

A configuration of motor holding brake and SBC was detected that is not practical.

The following configurations can result in this message:

- "No motor holding brake available" (p1215 = 0) and "SBC" enabled (p9602 = 1).
- "Motor holding brake just like the sequence control, connection via BICO" (p1215 = 3) and "SBC" enabled (p9602 = 1).

Note:

SBC: Safe Brake Control

**Remedy:**

Check the parameterization of the motor holding brake and SBC and correct.

**F01640 SI P1 (CU): component replacement identified and acknowledgment/save required**

**Message class:** General drive fault (19)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** The "Safety Integrated" function integrated in the drive has identified that a component has been replaced. It is no longer possible to operate the drive.  
When safety functions are active, after a component has been replaced it is necessary to carry out a partial acceptance test.  
Fault value (r0949, interpret binary):  
Bit 0 = 1:  
It has been identified that the Control Unit has been replaced.  
Bit 1 = 1:  
It has been identified that the Motor Module/Hydraulic Module has been replaced.  
Bit 2 = 1:  
It has been identified that the Power Module has been replaced.  
Bit 3 = 1:  
It has been identified that the Sensor Module channel 1 has been replaced.  
Bit 4 = 1:  
It has been identified that the Sensor Module channel 2 has been replaced.  
Bit 5 = 1:  
It has been identified that the sensor channel 1 has been replaced.  
Bit 6 = 1:  
It has been identified that the sensor channel 2 has been replaced.  
**Remedy:**  
- acknowledge component replacement (p9702 = 29).  
- save all parameters (p0977 = 1 or p0971 = 1 or "copy RAM to ROM").  
- acknowledge fault (e.g. BI: p2103).  
Note:  
In addition to the fault, diagnostics bits r9776.2 and r9776.3 are set.

**F01649****SI P1 (CU): Internal software error**

**Message class:** Hardware/software error (1)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** An internal error in the Safety Integrated software on processor 1 has occurred.

**Note:**

This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret hexadecimal):

Only for internal Siemens troubleshooting.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
- re-commission the "Safety Integrated" function and carry out a POWER ON.
- contact Technical Support.
- replace Control Unit.

---

**F01650****SI P1 (CU): Acceptance test required**

**Message class:** Safety monitoring channel has identified an error (10)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The drive-integrated "Safety Integrated" function on processor 1 requires an acceptance test.

**Note:**

This fault results in a STOP A that can be acknowledged.

Fault value (r0949, interpret decimal):

130: Safety parameters for processor 2 not available.

**Note:**

This fault value is always output when Safety Integrated is commissioned for the first time.

1000: Reference and actual checksum on processor 1 are not identical (booting).

- at least one checksum-checked piece of data is defective.

- safety parameters set offline and loaded into the Control Unit.

2000: Reference and actual checksum on processor 1 are not identical (commissioning mode).

- reference checksum incorrectly entered on processor 1 (p9799 not equal to r9798).

- when de-activating the safety functions, p9501 was not deleted.

2001: Reference and actual checksum on processor 2 are not identical (commissioning mode).

- reference checksum incorrectly entered on processor 2 (p9899 not equal to r9898).

- when de-activating the safety functions, p9501 was not deleted.

2002: Enable of safety-related functions between the processor 1 and processor 2 differ (p9601 not equal to p9801).

2003: Acceptance test is required as a safety parameter has been changed.

2004: An acceptance test is required because a project with enabled safety-functions has been downloaded.

2005: The Safety logbook has identified that a functional safety checksum has changed. An acceptance test is required.

2010: Enable of safety-related brake control between the two monitoring channels differ (p9602 not equal to p9802).

2020: Error when saving the safety parameters for the processor 2.

9999: Subsequent response of another safety-related fault that occurred when booting that requires an acceptance test.

**Remedy:**

For fault value = 130:

- carry out safety commissioning routine.

For fault value = 1000:

- again carry out safety commissioning routine.
- replace the memory card or Control Unit.

- Using STARTER, activate the safety parameters for the drive involved (change settings, copy parameters, activate settings).

For fault value = 2000:

- check the safety parameters on processor 1 and adapt the reference checksum (p9799).

For fault value = 2001:

- check the safety parameters on processor 2 and adapt the reference checksum (p9899).

For fault value = 2002:

- enable the safety-related functions on processor 1 and check processor 2 (p9601 = p9801).

For fault value = 2003, 2004, 2005:

- carry out an acceptance test and generate an acceptance report.

The fault with fault value 2005 can only be acknowledged when the "STO" function is de-selected.

For fault value = 2010:

- check the enable the safety-related brake control on both monitoring channels (p9602 = p9802).

For fault value = 2020:

- again carry out safety commissioning routine.
- replace the memory card or Control Unit.

For fault value = 9999:

- carry out diagnostics for the other safety-related fault that is present.

Note:

STO: Safe Torque Off

<b>F01651</b>	<b>SI P1 (CU): Synchronization safety time slices unsuccessful</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The "Safety Integrated" function requires synchronization of the safety time slices between processor 1 and processor 2. This synchronization routine was unsuccessful. Note: This fault results in a STOP A that cannot be acknowledged. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	Carry out a POWER ON (switch-off/switch-on).
<b>F01653</b>	<b>SI P1 (CU): PROFIBUS/PROFINET configuration error</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE (OFF1, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	There is a PROFIBUS/PROFINET configuration error for using Safety Integrated monitoring functions with a higher-level control. Note: For safety functions that have been enabled, this fault results in a STOP A that cannot be acknowledged. Fault value (r0949, interpret decimal): 200: A safety slot for receive data from the control has not been configured. 210, 220: The configured safety slot for the receive data from the control has an unknown format. 230: The configured safety slot for the receive data from the F-PLC has the incorrect length. 231: The configured safety slot for the receive data from the F-PLC has the incorrect length. 250: A PROFIsafe slot is configured in the higher-level F control, however PROFIsafe is not enabled in the drive. 300: A safety slot for the send data to the control has not been configured. 310, 320: The configured safety slot for the send data to the control has an unknown format. 330: The configured safety slot for the send data to the F-PLC has the incorrect length. 331: The configured safety slot for the send data to the F-PLC has the incorrect length.
<b>Remedy:</b>	The following generally applies: - check and, if necessary, correct the PROFIBUS/PROFINET configuration of the safety slot on the master side. - upgrade the Control Unit software. For fault value = 250: - remove the PROFIsafe configuring in the higher-level F control or enable PROFIsafe in the drive. For fault value = 231, 331: - configure the PROFIsafe telegram matching the parameterization in the F-PLC.

## 4 Faults and alarms

- Remedy:**
- re-commission the safety functions.
  - replace the memory card or Control Unit.
- For fault value = 129:
- activate the safety commissioning mode (p0010 = 95).
  - adapt the PROFIsafe address (p9610).
  - start the copy function for SI parameters (p9700 = D0 hex).
  - acknowledge data change (p9701 = DC hex).
  - exit the safety commissioning mode (p0010 = 0).
  - save all parameters (p0971 = 1 or "copy RAM to ROM").
  - carry out a POWER ON (switch-off/switch-on) for the Control Unit.
- For fault value = 132:
- check the electrical cabinet design and cable routing for EMC compliance

**F01658****SI P1 (CU): PROFIsafe telegram number not suitable**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The PROFIsafe telegram number in p60022 is unsuitable for the enabled safety functions.

Possible causes:

- When PROFIsafe is not enabled (p9601.3 = 0), then it is not permissible to select a PROFIsafe telegram in p60022.
- When PROFIsafe is enabled (p9601.3 = 1), then a PROFIsafe telegram must be selected in p60022.
- When the transfer of the F-DIs via PROFIsafe (p9501.30 = 1) is selected, then telegram 900 must be selected in p60022 (this only applies to Control Units, which support Extended Functions via PROFIsafe (r9771.4 = 1)).

Note:

This fault does not result in a safety stop response.

See also: p9501 (SI Motion enable safety functions (processor 1)), p9601 (SI enable functions integrated in the drive (processor 1)), p60022 (PROFIsafe telegram selection)

**Remedy:** Select the telegram number that matches the Safety functions that have been enabled.

**F01659****SI P1 (CU): Write request for parameter rejected**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The write request for one or several Safety Integrated parameters on processor 1 was rejected.

Note:

This fault does not result in a safety stop response.

Fault value (r0949, interpret decimal):

- 1: The Safety Integrated password is not set.
- 2: A reset of the drive parameters was selected. However, the Safety Integrated parameters were not reset, as Safety Integrated is presently enabled.
- 3: The interconnected STO input is in the simulation mode.
- 10: An attempt was made to enable the STO function although this cannot be supported.
- 14: An attempt was made to enable the PROFIsafe communications although this cannot be supported.
- 15: An attempt was made to enable the motion monitoring functions integrated in the drive although these cannot be supported.
- 18: An attempt was made to enable the PROFIsafe function for Basic Functions although this cannot be supported.
- 20: An attempt was made to simultaneously enable both the drive-integrated motion monitoring functions via integrated F-DI and STO via terminals, even though these cannot be supported at the same time.
- 21: An attempt was made to enable the Safety Integrated functions although these cannot be supported by the connected Power Module.
- 26: At a digital input of the Control Unit used by Safety Integrated, an attempt was made to activate the simulation mode.
- 28: An attempt was made to enable the "STO via terminals at the Power Module" function although this cannot be supported.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:**

- For fault value = 1:
  - set the Safety Integrated password (p9761).
- For fault value = 2:
  - inhibit Safety Integrated (p9501, p9601) or reset safety parameters (p0970 = 5), then reset the drive parameters again.
- For fault value = 3:
  - end the simulation mode for the digital input (p0795).
- For fault value = 10, 14, 15, 18:
  - check whether there are faults in the safety function alignment (F01655, F30655) and if required, carry out diagnostics for the faults involved.
  - use a Control Unit that supports the required function.
- For fault value = 20:
  - correct the enable setting (p9601).
- For fault value = 21:
  - use a Power Module that supports the Safety Integrated functions.
- For fault value = 26:
  - de-activate the simulation mode for the set signal source for STO (p9620) (p0795).
  - de-activate the simulation mode (p0795) for the F-DIs used by the Safety Integrated functions (r10049, p10006, p10009).
  - For the set test stop of the F-DO with feedback signal input (p10046, p10047), check the simulation mode, and if required, de-activate (p0795).
- For fault value = 28: use the power unit with the feature "STO via terminals at the Power Module".

Note:  
F-DI: Failsafe Digital Input  
STO: Safe Torque Off

**F01660**      **SI P1 (CU): Safety-related functions not supported**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The Power Module does not support the safety-related functions. Safety Integrated cannot be commissioned.  
Note:  
This fault does not result in a safety stop response.

**Remedy:** - use a Power Module that supports the safety-related functions.

---

**F01661**      **SI P1 (CU): Simulation of the safety inputs active**

**Message class:** General drive fault (19)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** The simulation of the digital inputs of the Control Unit (p0795) is active.  
It is not permissible that safety inputs are simulated.  
Fault value (r0949, interpret binary):  
The displayed bits indicate which digital inputs must not be simulated.

**Remedy:** - de-activate the simulation of the digital inputs of the Control Unit for the safety inputs (p0795).  
- acknowledge fault.

---

**F01662**      **Error internal communications**

**Message class:** Hardware/software error (1)  
**Reaction:** OFF2  
**Acknowledge:** POWER ON  
**Cause:** A module-internal communication error has occurred.  
Fault value (r0949, interpret hexadecimal):  
Only for internal Siemens troubleshooting.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
- upgrade firmware to later version.
- contact Technical Support.

**F01663****SI P1 (CU): Copying the SI parameters rejected**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** In p9700, the value 87 or 208 is saved or was entered offline.

This is the reason that when booting, an attempt is made to copy Safety Integrated parameters from processor 1 to processor 2. However, no safety-relevant function has been selected on processor 1 (p9501 = 0, p9601 = 0). This is the reason that copying is not possible.

**Note:**

This fault does not result in a safety stop response.

SI: Safety Integrated

See also: p9700 (SI copy function)

**Remedy:**

- set p9700 to 0.
- check p9501 and/or p9601 and if required, correct.
- restart the copying function by entering the corresponding value into p9700.

**F01665****SI P1 (CU): System is defective**

**Message class:** Hardware/software error (1)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A system defect was detected before the last boot or in the actual one. The system might have been rebooted (reset).

Fault value (r0949, interpret hexadecimal):

40 hex:

- For a Power Module with "STO via terminals at the Power Module" (STO\_A/STO\_B), these terminals are active (DIP switch to "ON"). However, the "STO via terminals at the Power Module" function has not been enabled (p9601.7 = p9801.7 = 0).

200000 hex, 400000 hex, 8000yy hex (yy any):

- fault in the actual booting/operation.

Additional values:

- defect before the last time that the system booted.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
  - upgrade firmware to later version.
  - contact Technical Support.
- For fault value = 40 hex:
- de-activate terminals STO\_A/STO\_B on the Power Module (set both DIP-switches to "OFF") or enable the "STO via terminals at the Power Module" function.
- For fault value = 200000 hex, 400000 hex, 8000yy hex (yy any):
- ensure that the Control Unit is connected to the Power Module.
  - deselect the "STO via terminals at the Power Module" function.

**A01666 (F)****SI Motion P1 (CU): Steady-state (static) 1 signal at the F-DI for safe acknowledgment**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A logical 1 signal is present at the F-DI configured in p10006 for more than 10 seconds.

If, at the F-DI no acknowledgment was performed for safe acknowledgment, then a steady-state logical and 0 signal must be present. This avoids unintentional safety-relevant acknowledgment (or the "Internal Event Acknowledge" signal) if a wire breaks or one of the two digital inputs bounces.

**Remedy:**

Set the fail-safe digital input (F-DI) to a logical 0 signal (p10006).

**Note:**

F-DI: Failsafe Digital Input

<b>A01669 (F, N)</b>	<b>SI Motion: Unfavorable combination of motor and power unit</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The combination of motor and power unit used is not suitable for using safe motion monitoring functions without an encoder. The ratio between the power unit rated current (r0207[0]) and rated motor current (p0305) is greater than 5. Alarm value (r2124, interpret decimal): Number of the motor data set, which caused the fault. Notice: If this alarm is not observed, then message C01711 or C30711 – with the value 1041 ... 1044 – can sporadically occur.
<b>Remedy:</b>	Use a suitable power unit with a lower power rating or a motor with a higher power rating.

<b>A01678 (F)</b>	<b>SI: Test stop for STO via terminals required at the PM</b>
<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The time (p9661) set to monitor the forced checking procedure (test stop) for the "STO via the terminals at the Power Module" function has been exceeded. A new forced checking procedure is required. After the next time the "STO via terminals at the Power Module" function is deselected, the message is withdrawn and the monitoring time is reset. Note: - this message does not result in a safety stop response. - the test must be performed within a defined, maximum time interval (p9661, maximum of 9000 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning. See also: p9661 (SI forced checking procedure STO via PM terminals time), r9662 (SI forced checking procedure STO via PM terminals remaining time)

<b>F01680</b>	<b>SI Motion P1 (CU): Checksum error safety monitoring functions</b>
<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The actual checksum calculated by the drive and entered in r9728 via the safety-relevant parameters does not match the reference checksum saved in p9729 at the last machine acceptance. Safety-relevant parameters have been changed or a fault is present. Note: This fault results in a STOP A that can be acknowledged. Fault value (r0949, interpret decimal): 0: Checksum error for SI parameters for motion monitoring. 1: Checksum error for SI parameters for actual values. 2: Checksum error for SI parameters for component assignment.
<b>Remedy:</b>	- check the safety-relevant parameters and if required, correct. - execute the function "Copy RAM to ROM". - perform a POWER ON if safety parameters requiring a POWER ON have been modified. - carry out an acceptance test.

#### **F01683 SI Motion P1 (CU): SLS enable missing**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The safety-relevant function "SLS" is not enabled in p9501 although other safety-relevant monitoring functions are enabled.  
Note:  
This fault does not result in a safety stop response.  
**Remedy:** Enable the function "SLS" (p9501.0) and carry out a POWER ON.  
Note:

#### **F01690 SI Motion: Data save problem for the NVRAM**

**Message class:** Hardware/software error (1)  
**Reaction:** NONE (OFF1, OFF2, OFF3)  
**Acknowledge:** POWER ON  
**Cause:** There is not sufficient memory space in the NVRAM on the drive to save parameters r9781 and r9782 (safety logbook).  
Note:  
This fault does not result in a safety stop response.  
Fault value (r0949, interpret decimal):  
0: There is no physical NVRAM available in the drive.  
1: There is no longer any free memory space in the NVRAM.  
**Remedy:** For fault value = 0:  
- use a Control Unit NVRAM.  
For fault value = 1:  
- deselect functions that are not required and that take up memory space in the NVRAM.  
- contact Technical Support.

<b>A01699 (F)</b>	<b>SI P1 (CU): Test stop for STO required</b>
<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The time set in p9659 for the forced checking procedure (test stop) for the "STO" function has been exceeded. A new forced checking procedure is required. After the next time the "STO" function is de-selected, the message is withdrawn and the monitoring time is reset. Note: - this message does not result in a safety stop response. - the test must be performed within a defined, maximum time interval (p9659, maximum of 9000 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning. <b>C01700</b>	<b>SI Motion P1 (CU): STOP A initiated</b>
<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The drive is stopped via a STOP A (pulses are suppressed via the safety switch-off signal path of processor 1). Possible causes: - stop request from processor 2. - Pulses not suppressed after test stop selection. - subsequent response to the message C01706 "SI Motion P1: SAM/SBR limit exceeded". - Subsequent response to the message C01714 "SI Motion P1: Safely Limited Speed exceeded". - Subsequent response to the message C01701 "SI Motion P1: STOP B initiated".
<b>Remedy:</b>	- remove the cause of the fault on the monitoring channel of processor 2. - carry out a diagnostics routine for message C01706. - carry out a diagnostics routine for message C01714. - carry out a diagnostics routine for message C01701. - check the switch-off signal path of processor 1. - replace Power Module. - replace Control Unit. This message can be acknowledged without a POWER ON using "Acknowledge internal event": Note: SAM: Safe Acceleration Monitor (safe acceleration monitoring) SBR: Safe Brake Ramp (safe brake ramp monitoring)

<b>C01701</b>	<b>SI Motion P1 (CU): STOP B initiated</b>
<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Reaction:</b>	NONE (OFF3)
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The drive is stopped via a STOP B (braking along the OFF3 deceleration ramp). As a result of this fault, after the speed threshold parameterized in p9560 is fallen below, message C01700 "STOP A initiated" is output. Possible causes: - stop request from processor 2. - Subsequent response to the message C01714 "SI Motion P1: Safely Limited Speed exceeded". - subsequent response to the message C01711 "SI Motion P1: Defect in a monitoring channel". - subsequent response to the message C01707 "SI Motion P1: tolerance for safe operating stop exceeded".
<b>Remedy:</b>	- remove the cause of the fault on the monitoring channel of processor 2. - carry out a diagnostics routine for message C01714. - carry out a diagnostics routine for message C01711. - carry out a diagnostics routine for message C01707. This message can be acknowledged without a POWER ON using "Acknowledge internal event".

<b>C01706</b>	<b>SI Motion P1 (CU): SAM/SBR limit exceeded</b>
<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	Motion monitoring functions with set acceleration monitoring (SAM, p9506 = 3): - after initiating STOP B (SS1) the velocity has exceeded the selected tolerance. Motion monitoring functions with set brake ramp monitoring (SBR, p9506 = 1): - after initiating STOP B (SS1) or SLS changeover to the lower speed stage, the speed has exceeded the selected tolerance. The drive is shut down by the message C01700 "SI Motion: STOP A initiated".
<b>Remedy:</b>	Check the braking behavior and, if necessary, adapt the parameterization of the parameter settings of the "SAM" or the "SBR" function. <b>C01711</b>	<b>SI Motion P1 (CU): Defect in a monitoring channel</b>
<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible. If at least one monitoring function is active, then message C01701 "SI Motion: STOP B initiated" is output. The message value that resulted in a STOP F is displayed in r9725. The message values described involve the crosswise data comparison between processor 1 and processor 2. The following message values may also occur in the following cases if the cause that is explicitly mentioned does not apply: - synchronization error between processor 1 and processor 2.

## 4 Faults and alarms

### 4.2 List of faults and alarms

Message value (r2124, interpret decimal):

0 to 999: Number of the cross-compared data that resulted in this fault.

0: Stop request from the other monitoring channel.

1: Status image of monitoring functions SLS or SAM/SBR (result list 1) (r9710[0], r9710[1]).

2: Status image of monitoring function  $n < n_x$  (result list 2) (r9711[0], r9711[1]).

3: The position actual value differential (r9713[0/1]) between the two monitoring channels is greater than the tolerance in p9542/p9342.

4: Error when synchronizing the crosswise data comparison between the two channels.

5: Function enable signals (p9501/p9301) Safety monitoring clock cycle too small (p9500/p9300).

6: Limit value for SLS1 (p9531[0]/p9331[0])

7: Limit value for SLS2 (p9531[1]/p9331[1])

44 ... 57: General

Possible cause 1 (during commissioning or parameter modification)

The tolerance value for the monitoring function is not the same on the two monitoring channels.

Possible cause 2 (during active operation)

The limit values are based on the actual value (r9713[0/1]). If the safe actual values on the two monitoring channels do not match, the limit values, which have been set at a defined interval, will also be different (i.e. corresponding to message value 3). This can be ascertained by checking the safe actual positions.

Permissible deviation between the two monitoring channels: p9542/p9342.

44: Position actual value (r9713[0/1]) + limit value SLS1 (p9531[0]/p9331[0]) \* safety monitoring clock cycle (12 ms).

Error in the PROFIsafe control.

For these message values, the failsafe control signals (failsafe values) are transferred to the safety functions.

The significance of the individual message values is described in safety fault F01611.

Message values that have not been listed are only for internal Siemens troubleshooting.

See also: r9725 (SI Motion diagnostics STOP F)

**Remedy:**

For message value = 0:

- no error was identified in this monitoring channel. Note the error message of the other monitoring channel (for processor 2: C30711).

For message value = 3:

Commissioning phase:

- check the setting of the gear parameters on both monitoring channels (p9521/p9321, p9522/p9322).
- check the numerator of the gear ratio to ensure that it takes into account the motor pole pair number (p9522/p9322).

In operation:

- increase the ramp-function generator ramp-up/down time (p1120/p1121), reduce the dynamic performance of the drive.

For message value = 1 ... 999:

- if the message value is listed under cause: Check the crosswise-compared parameters to which the message value refers.

- copy the safety parameters.
- carry out a POWER ON (switch-off/switch-on).
- upgrade the Control Unit software.

For message value = 1000:

- investigate the signal associated with the F-DI (contact problems).

For message value = 1001:

- carry out a POWER ON (switch-off/switch-on).
- upgrade the Control Unit software.

For message value = 1005:

- check the conditions for pulse enable.

For message value = 1011:

- for diagnostics, refer to parameter (r9571).

For message value = 1020:

- carry out a POWER ON (switch-off/switch-on).
- replace Control Unit.

For message value = 1041:

- reduce the minimum current (p9588).

For message value = 1042:

- increase the ramp-function generator ramp-up/down time (p1120/p1121).
- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
- reduce the dynamic response of the setpoint value.
- increase the minimum current (p9588).

For message value = 1043:

- increase the voltage tolerance (p9589).
- increase the ramp-function generator ramp-up/down time (p1120/p1121).
- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
- reduce the dynamic response of the setpoint value.

For message value = 6000 ... 6999:

Refer to the description of the message values in safety fault F01611.

#### C01712

#### SI Motion P1 (CU): Defect in F-IO processing

**Message class:**

Safety monitoring channel has identified an error (10)

**Reaction:**

NONE

**Acknowledge:**

IMMEDIATELY (POWER ON)

**Cause:**

When cross checking and comparing the two monitoring channels, the drive detected a difference between parameters or results of the F-IO processing and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.

The safety message C01711 with message value 0 is also displayed due to initiation of STOP F.

If at least one monitoring function is active, then safety message C01701 "SI Motion: STOP B initiated" is output.

Message value (r2124, interpret decimal):

Number of the cross-compared data that resulted in this message.

- 1: SI discrepancy monitoring time inputs (p10002, p10102).
- 2: SI acknowledgment internal event input terminal (p10006, p10106).
- 3: SI STO input terminal (p10022, p10122).
- 4: SI SS1 input terminal (p10023, p10123).
- 7: SI SLS input terminal (p10026, p10126).
- 13: Different states for static inactive signal sources (p10006, p10022 ... p10026).
- 14: SI discrepancy monitoring time outputs (p10002, p10102).
- 15: SI acknowledgment internal event (p10006, p10106).
- 46: SI digital inputs debounce time (p10017, p10117)
- 47: Selection F-DI for PROFIsafe (p10050, p10150)
- 48: Selection F-DI for PROFIsafe (p10050, p10150)
- 49: SI SDI positive input terminal (p10030, p10130).
- 50: SI SDI negative input terminal (p10031, p10131).

**Remedy:**

- check parameterization in the parameters involved and correct if required.
- ensure equality by copying the SI data to processor 2 and then carry out an acceptance test.

<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The fail-safe digital inputs (F-DI) show a different state longer than that parameterized in p10002 / p10102. Fault value (r0949, interpret binary): Bit 0: Discrepancy error for F-DI 0 Bit 1: Discrepancy error for F-DI 1 ...
<b>Note:</b>	If several discrepancy errors occur consecutively, then this message is only signaled for the first error that occurs.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:** - check the wiring of the F-DI (contact problems).

**Note:**  
This message can be acknowledged via F-DI or PROFIsafe.  
Discrepancy errors of an F-DI can only be acknowledged if safe acknowledgment was carried out once after the cause of the error was resolved (p10006, acknowledgment via PROFIsafe, extended message acknowledgment). As long as safety acknowledgment was not carried out, the corresponding F-DI stays in the safe state internally.  
When the "Extended message acknowledgment" function (p9507.0) is active, the following applies:  
If the F-DI assigned for STO or SS1 is in a fail-safe state due to a discrepancy error, then when deselecting via this F-DI, safe acknowledgment can no longer be executed.  
For cyclic switching operations at the F-DI, it may be necessary to adapt the discrepancy time to the switching frequency.  
If the period of a cyclic switching pulse corresponds to twice the value of p10002, then the following formulas should be checked:  
-  $p10002 < (tp / 2) - td$  (discrepancy time must be less than half the period minus the actual discrepancy time)  
-  $p10002 \geq 12 \text{ ms}$  (discrepancy time must be no less than 12 ms)  
-  $p10002 > td$  (discrepancy time must be greater than the switch discrepancy time which may actually apply)  
 $td$  = possible actual discrepancy time (in ms) that can occur with a switching operation. It must be at least 12 ms.  
 $tp$  = period for a switching operation in ms.  
When debounce p10017 is active, the discrepancy time is directly specified by the debounce time.  
If the period of a cyclic switching pulse corresponds to twice the debounce time, then the following formulas should be checked.  
-  $p10002 < p10017 + 1 \text{ ms} - td$   
-  $p10002 > td$   
-  $p10002 \geq 12 \text{ ms}$   
**Example:**  
For a 110 ms switching frequency and  $p10017 = 0$ , the maximum discrepancy time that can be set is as follows:  
 $p10002 \leq (110/2 \text{ ms}) - 12 \text{ ms} = 43 \text{ ms}$   
Rounded off,  $p10002 \leq 36 \text{ ms}$  is obtained (as the discrepancy time is rounded off as a multiple of 12 ms).

**F01773**      **SI Motion P1 (CU): Test stop fail-safe digital output error**

**Message class:** Safety monitoring channel has identified an error (10)

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** A fault has occurred on processor 1 during the forced checking procedure (test stop) of the fail-safe digital output.  
Fault value (r0949, interpret hexadecimal):  
RRRVWXYZ hex:  
R: Reserved.  
V: Actual state of the DO channel concerned (see X) on processor 1 (corresponds to the states read back from the hardware, bit 0 = DO 0, bit 1 = DO 1, etc.).  
W: Required state of the DO channel concerned (see X, bit 0 = DO 0, bit 1 = DO 1, etc.).  
X: DO channels involved, which indicate an error (bit 0 = DO 0, bit 1 = DO 1, etc.).  
Y: Reason for the test stop fault.  
Z: State of the test stop in which the fault has occurred.

Y: Reason for the test stop fault

Y = 1: MM side in incorrect test stop state (internal fault).

Y = 2: Expected states of the DOs were not fulfilled (CU240D-2: readback via DI 5 / CU250S-2 readback via DI 6).

Y = 3: Incorrect timer state on processor 1 (internal fault)

Y = 4: Expected states of the diag DOs were not fulfilled (CU240D-2: internal readback on processor 2 channel / CU250S-2 readback via DI 6).

Y = 5: Expected states of the second diag DOs were not fulfilled (CU240D-2: internal readback on processor 1).

X and V indicate the DI or Diag-DO state dependent upon the reason for the fault (2, 4 or 5).

In the event of multiple test stop faults, the first one that occurred is shown.

Z: Test stop state and associated test actions

Z = 0 ... 3: Synchronization phase of test stop between processor 1 and processor 2 no switching operations

Z = 4: DO + OFF and DO - OFF

Z = 5: Check to see if states are as expected

Z = 6: DO + ON and DO - ON

Z = 7: Check to see if states are as expected

Z = 8: DO + OFF and DO - ON

Z = 9: Check to see if states are as expected

Z = 10: DO + ON and DO - OFF

Z = 11: Check to see if states are as expected

Z = 12: DO + OFF and DO - OFF

Z = 13: Check to see if states are as expected

Z = 14: End of test stop

5: -/1/1/-

7: -/0/0/-

9: -/0/1/-

11: -/0/1/-

13: -/1/1/-

Example:

Fault F01773 (P1) is signaled with fault value = 0001\_0127 and fault F30773 (P2) is signaled with fault value 0000\_0127.

This means that in state 7 (Z = 7) the state of the external readback signal was not set correctly (Y = 2) after DO-0 (X = 1) was switched to ON/ON.

Fault value 0001\_0127 indicates that 0 was expected (W = 0) and 1 (V = 1) was read back from the hardware.

Fault value 0000\_0127 on the processor 2 indicates that the states were as expected.

In the case of fault F30773, W and V are always identical; a value of 0 always means that 0 was expected at the readback input but was not present on processor 1.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

**Remedy:** Check the wiring of the fail-safe digital output (F-DO) and restart the test stop.  
**Note:**  
- the fault is withdrawn if the test stop is successfully completed.  
- in the event of multiple test stop faults, the first one that occurred is shown. Once the test stop has been restarted the next queued test stop fault will be signaled (if there is one).

#### **A01774 SI Motion P1 (CU): Test stop for fail-safe digital outputs required**

**Message class:** Safety monitoring channel has identified an error (10)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The time set in p10003 for the forced checking procedure (test stop) for the fail-safe digital outputs has been exceeded. A new forced checking procedure is required.  
After the next time the forced checking procedure is selected, the message is withdrawn and the monitoring time is reset.

**Note:**

- this message does not result in a safety stop response.

- the test must be performed within a defined, maximum time interval (p10003, maximum of 8760 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning.

See also: p10003 (SI motion forced checking procedure timer)

**Remedy:** Carry out the forced checking procedure for the digital outputs.

The signal source to select the forced checking procedure is set via binector input p10007.

#### **A01788 SI: Automatic test stop waits for STO deselection via motion monitoring functions**

**Message class:** Safety monitoring channel has identified an error (10)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The automatic test stop (forced checking procedure) was not able to be carried out after powering up.

Possible causes:

- the STO function is selected via safe motion monitoring functions.

- a safety message is present, that resulted in a STO.

**Note:**

STO: Safe Torque Off

**Remedy:** - deselect STO via safe motion monitoring functions.

- remove the cause of the safety messages and acknowledge the messages.

**Note:**

The automatic test stop is performed after removing the cause.

---

#### **A01790 SI: Power up stopped due to STO via terminals**

**Message class:** Safety monitoring channel has identified an error (10)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** When powering up, the automatic internal self test of the Control Unit was not able to be completed as the pulses were not enabled. It is possible that the "STO via terminals at the Power Module" function is being used, and STO is selected in at least one hardware switch-off signal path at the Power Module.

**Remedy:**

- Deselect STO via the STO terminals at the Power Module (connect STO\_A and STO\_B to 24 V).
- if required, de-activate the "STO via terminals at the Power Module" function via the DIP switch (both DIP switches set to "OFF").

**Note:**

- After the cause has been removed, the Control Unit continues to power up.
- While the alarm remains, a possibly existing brake is kept closed.

**A01796 (F, N)      SI P1 (CU): Wait for communication**

**Message class:** Communication error to the higher-level control system (9)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The drive waits for communication to be established to execute the safety-relevant motion monitoring functions.

**Note:**

In this state, the pulses are safely suppressed.

Alarm value (r2124, interpret decimal):

3: Wait for communication to be established to PROFIsafe F-Host.

**Remedy:** If, after a longer period of time, the message is not automatically withdrawn, the following checks have to be made:

- check any other PROFIsafe communication messages/signals present and evaluate them.
- check the operating state of the F-Host.
- check the communication connection to the F Host.

**C01799              SI Motion P1 (CU): Acceptance test mode active**

**Message class:** Safety monitoring channel has identified an error (10)

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The acceptance test mode is active.

**Remedy:** Not necessary.

The message is withdrawn when exiting the acceptance test mode.

**F01800              DRIVE-CLiQ: Hardware/configuration error**

**Message class:** Internal (DRIVE-CLiQ) communication error (12)

**Reaction:** NONE (IASC/DCBRK, OFF1, OFF2, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** A DRIVE-CLiQ connection fault has occurred.

Fault value (r0949, interpret decimal):

100 ... 107:

Communication via DRIVE-CLiQ socket X100 ... X107 has not been switched to cyclic operation. The cause may be an incorrect structure or a configuration that results in an impossible bus timing.

10:

Loss of the DRIVE-CLiQ connection. The cause may be, for example, that the DRIVE-CLiQ cable was withdrawn from the Control Unit or as a result of a short-circuit for motors with DRIVE-CLiQ. This fault can only be acknowledged in cyclic communication.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

11:

Repeated faults when detecting the connection. This fault can only be acknowledged in cyclic communication.

12:

A connection was detected but the node ID exchange mechanism does not function. The reason is probably that the component is defective. This fault can only be acknowledged in cyclic communication.

**Remedy:**

For fault value = 100 ... 107:

- ensure that the DRIVE-CLiQ components have the same firmware versions.
- avoid longer topologies for short current controller clock cycles.

For fault value = 10:

- check the DRIVE-CLiQ cables at the Control Unit.
- remove any short-circuit for motors with DRIVE-CLiQ.
- carry out a POWER ON.

For fault value = 11:

- check the electrical cabinet design and cable routing for EMC compliance

For fault value = 12:

- replace the component involved.

---

#### **A01839 DRIVE-CLiQ diagnostics: cable fault to the component**

**Message class:** General drive fault (19)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The fault counter (r9936[0...199]) to monitor the DRIVE-CLiQ connections/cables has been incremented.

Alarm value (r2124, interpret decimal):

Component number.

Note:

The component number specifies the component whose feeder cable from the direction of the Control Unit is faulted.

The alarm automatically disappears after 5 seconds, assuming that no other data transfer error has occurred.

#### **A01840 SMI: Component found without motor data**

**Message class:** Hardware/software error (1)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** An SMI/DQI without motor data has been found (e.g. SMI installed as replacement part).

Alarm value (r2124, interpret decimal):

Component number from target topology.

**Remedy:**

1. Download the SMI/DQI data (motor/encoder data) from the data backup again (p4690, p4691).
2. Carry out a POWER ON (switch-off/switch-on) for this component.

#### **A01900 (F) PROFIBUS: Configuration telegram error**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A PROFIBUS master attempts to establish a connection using an incorrect configuring telegram.

Alarm value (r2124, interpret decimal):

2: Too many PZD data words for input or output. The number of possible PZD is specified by the number of indices in r2050/p2051.

3: Uneven number of bytes for input or output.

211: Unknown parameterizing block.

501: PROFIsafe parameter error (e.g. F\_dest).

502: PROFIsafe telegram does not match.  
Additional values:  
Only for internal Siemens troubleshooting.  
**Remedy:** Check the bus configuration on the master and slave sides.  
For alarm value = 2:  
Check the number of data words for input and output.  
For alarm value = 211:  
Ensure offline version <= online version.  
For alarm value = 501:  
Check the set PROFIsafe address (p9610).  
For alarm value = 502:  
Check the enable of F-DI (p9501.30).

**F01910 (N, A)      Fieldbus interface setpoint timeout**  
**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)  
**Acknowledge:** IMMEDIATELY  
**Cause:** The reception of setpoints from the fieldbus interface has been interrupted.  
- bus connection interrupted.  
- communication partner switched off.  
For PROFIBUS:  
- PROFIBUS master set into the STOP state.  
See also: p2040 (Fieldbus interface monitoring time), p2047 (PROFIBUS additional monitoring time)  
**Remedy:** Ensure bus connection has been established and switch on communication partner.  
- if required, adapt p2040.  
For PROFIBUS:  
- set the PROFIBUS master to the RUN state.  
- if the error is repeated, check the set response monitoring in the bus configuration (HW Config).  
- slave redundancy: For operation on a Y link, it must be ensured that "DP alarm mode = DPV1" is set in the slave parameterization.

**F01912 (N, A)      PB/PN clock cycle synchronous operation sign-of-life failure**  
**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** OFF1 (OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** The maximum permissible number of errors in the controller sign-of-life (clock synchronous operation) has been exceeded in cyclic operation.  
**Remedy:**  
- physically check the bus (cables, connectors, terminating resistor, shielding, etc.).  
- correct the interconnection of the controller sign-of-life (p2045).  
- check whether the controller correctly sends the sign-of-life (e.g. create a trace with STW2.12 ... STW2.15 and trigger signal ZSW1.3).  
- check the permissible telegram failure rate (p0925).  
- check the bus and controller for utilization level (e.g. bus cycle time Tdp was set too short).

**A01920 (F)      PROFIBUS: Interruption cyclic connection**  
**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The cyclic connection to the PROFIBUS master is interrupted.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

**Remedy:** Establish the PROFIBUS connection and activate the PROFIBUS master in the cyclic mode.  
**Note:**  
If there is no communication to a higher-level control system, then p2030 should be set = 0 to suppress this message.  
See also: p2030 (Field bus int protocol selection)

**A01944**      **PB/PN sign-of-life synchronism not reached**  
**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The bus is in the data exchange state and clock synchronous operation has been selected using the parameterizing telegram.  
Synchronization with the master sign-of-life (STW2.12 ... STW2.15) could not be completed because the sign-of-life is changing differently to how it was configured in the Tmapc time grid.  
**Remedy:**  
- ensure that the master correctly increments the sign-of-life in the master application clock cycle Tmapc.  
- correct the interconnection of the master sign-of-life (p2045).

**A01945**      **PROFIBUS: Connection to the Publisher failed**  
**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** For PROFIBUS peer-to-peer data transfer, the connection to at least one Publisher has failed.  
Alarm value (r2124, interpret binary):  
Bit 0 = 1: Publisher with address in r2077[0], connection failed.  
...  
Bit 15 = 1: Publisher with address in r2077[15], connection failed.  
**Remedy:**  
Check the PROFIBUS cables.

**F01946 (A)**      **PROFIBUS: Connection to the Publisher aborted**  
**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** OFF1 (NONE, OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The connection to at least one Publisher for PROFIBUS peer-to-peer data transfer in cyclic operation has been aborted.  
Fault value (r0949, interpret binary):  
Bit 0 = 1: Publisher with address in r2077[0], connection aborted.  
...  
Bit 15 = 1: Publisher with address in r2077[15], connection aborted.  
**Remedy:**  
- check the PROFIBUS cables.  
- check the state of the Publisher that has the aborted connection.

**F01951**      **CU SYNC: Synchronization application clock cycle missing**  
**Message class:** Internal (DRIVE-CLiQ) communication error (12)  
**Reaction:** OFF2 (NONE)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** Internal synchronization of the application cycles unsuccessful.  
Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.  
**Remedy:**  
- carry out a POWER ON (switch-off/switch-on) for all components.  
- upgrade the Control Unit software.

<b>Acknowledge:</b>	NONE
<b>Cause:</b>	- the specified signal does not exist. - the specified signal can no longer be traced (recorded).
<b>Remedy:</b>	- specify the signal to be traced. - check whether the relevant signal can be traced.

---

<b>A02062</b>	<b>Trace: Invalid trigger signal</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	- a trigger signal was not specified. - the specified signal does not exist. - the specified signal is not a fixed-point signal. - the specified signal cannot be used as a trigger signal for the trace.
<b>Remedy:</b>	Specify a valid trigger signal.

---

<b>A02063</b>	<b>Trace: Invalid data type</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The specified data type to select a signal using a physical address is invalid.
<b>Remedy:</b>	Use a valid data type.

---

<b>A02070</b>	<b>Trace: Parameter cannot be changed</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The trace parameter settings cannot be changed when the trace is active.
<b>Remedy:</b>	- stop the trace before parameterization. - if required, start the trace.

---

<b>A02075</b>	<b>Trace: Pretrigger time too long</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The selected pretrigger time must be shorter than the trace time.
<b>Remedy:</b>	Check the pretrigger time setting and change if necessary.

---

<b>F02080</b>	<b>Trace: Parameterization deleted due to unit changeover</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The trace parameterization in the drive unit was deleted due to a unit changeover or a change in the reference parameters.
<b>Remedy:</b>	Restart trace.

---

<b>A02095</b>	<b>MTrace 0: multiple trace cannot be activated</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The following functions or settings are not permissible in conjunction with a multiple trace (trace recorder 0): - measuring function - long-time trace - trigger condition "immediate recording start" (IMMEDIATE) - trigger condition "start with function generator" (FG_START)
<b>Remedy:</b>	- if required, de-activate the multiple trace (p4840[0] = 0). - de-activate function or setting that is not permissible

---

<b>A02096</b>	<b>MTrace 0: cannot be saved</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	It is not possible to save the measurement results of a multiple trace on the memory card (trace recorder 0). A multiple trace is not started or is canceled. Alarm value (r2124, interpret decimal): 1: Memory card cannot be accessed. - card is not inserted or is blocked by a mounted USB drive. 3: data save operation too slow. - a second trace has been completed before the measurement results of the first trace were able to be saved. - writing the measurement result files to the card is blocked by the parameter save. 4: Data save operation canceled. - for instance, the file required for the data save operation was not able to be found.
<b>Remedy:</b>	- insert or remove the memory card. - use a larger memory card. - configure a longer trace time or use an endless trace. - avoid saving parameters while a multiple trace is running. - check whether other functions are presently accessing measurement result files.

---

**A02097 MTrace 1: multiple trace cannot be activated**

<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE

**A02099 Trace: Insufficient Control Unit memory**

<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The memory space still available on the Control Unit is no longer sufficient for the trace function.
<b>Remedy:</b>	Reduce the memory required, e.g. as follows: <ul style="list-style-type: none"><li>- reduce the trace time.</li><li>- increase the trace clock cycle.</li><li>- reduce the number of signals to be traced.</li></ul>

**A02150 OA: Application cannot be loaded**

<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The system was not able to load an OA application. Alarm value (r2124, interpret hexadecimal): 16: The interface version in the DCB user library is not compatible to the DCC standard library that has been loaded. Only for internal Siemens troubleshooting.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.

For alarm value = 16:  
Load a compatible DCB user library (compatible to the interface of the DCC standard library).

Note:  
OA: Open Architecture  
DCB: Drive Control Block  
DCC: Drive Control Chart

**F02151 (A)      OA: Internal software error**

**Message class:** Hardware/software error (1)  
**Reaction:** OFF2 (NONE, OFF1, OFF3)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** An internal software error has occurred within an OA application.  
Fault value (r0949, interpret hexadecimal):  
Only for internal Siemens troubleshooting.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.
- replace the Control Unit.

Note:  
OA: Open Architecture

---

**F02152 (A)      OA: Insufficient memory**

**Message class:** Hardware/software error (1)  
**Reaction:** OFF1  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** Too many functions have been configured on this Control Unit (e.g. too many drives, function modules, data sets, OA applications, blocks, etc).  
Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.

**Remedy:**

- change the configuration on this Control Unit (e.g. fewer drives, function modules, data sets, OA applications, blocks, etc).
- use an additional Control Unit.

Note:  
OA: Open Architecture

**F03000      NVRAM fault on action**

**Message class:** Hardware/software error (1)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** A fault occurred during execution of action p7770 = 1 or 2 for the NVRAM data.  
Fault value (r0949, interpret hexadecimal):  
yyxx hex: yy = fault cause, xx = application ID  
yy = 1:  
The action p7770 = 1 is not supported by this version if Drive Control Chart (DCC) is activated for the drive object concerned.  
yy = 2:  
The data length of the specified application is not the same in the NVRAM and the backup.  
yy = 3:  
The data checksum in p7774 is not correct.  
yy = 4:  
No data available to load.

**Remedy:**

- Perform the remedy according to the results of the troubleshooting.
- if necessary, start the action again.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

#### **F03001 NVRAM checksum incorrect**

**Message class:** Hardware/software error (1)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** A checksum error occurred when evaluating the non-volatile data (NVRAM) on the Control Unit.  
The NVRAM data affected was deleted.  
**Remedy:** Carry out a POWER ON (switch-off/switch-on) for all components.

---

#### **F03500 (A) TM: Initialization**

**Message class:** Hardware/software error (1)  
**Reaction:** OFF1 (OFF2)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** When initializing the Terminal Modules, the terminals of the Control Unit or the Terminal Board 30, an internal software error has occurred.  
Fault value (r0949, interpret decimal):  
yxxx dex  
y = Only for internal Siemens troubleshooting  
xxx = component number (p0151)  
**Remedy:**  
- switch off/switch on the power supply for the Control Unit.  
- check the DRIVE-CLiQ connection.  
- if required, replace the Terminal Module.  
The Terminal Module should be directly connected to a DRIVE-CLiQ socket of the Control Unit.  
If the fault occurs again, replace the Terminal Module.

---

#### **A03501 TM: Sampling time change**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The sampling times of the inputs/outputs were changed.  
This change only becomes valid after the next boot.  
**Remedy:** Carry out a POWER ON.

---

#### **F03505 (N, A) Analog input wire breakage**

**Message class:** External measured value / signal state outside the permissible range (16)  
**Reaction:** OFF1 (NONE, OFF2)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The wire-break monitoring for an analog input has responded.  
The input value of the analog input has undershot the threshold value parameterized in p0761[0...1]. p0756[0]: analog input 0 (terminal 3/4)  
p0756[1]: analog input 1 (terminal 10/11)  
Fault value (r0949, interpret decimal):  
Note:  
For the following analog input type, the wire breakage monitoring is active:  
p0756[0...1] = 3 (4 ... 20 mA with monitoring)  
**Remedy:**  
- check the wiring to the signal source for interruptions.  
- check the magnitude of the injected current - it is possible that the infed signal is too low.  
- check the load resistor (250 Ohm).  
Note:  
The input current measured by the analog input can be read in r0752[0].  
For p756[0...1] = 3 (unipolar current input monitored (+4 ... +20 mA)) the following applies:  
A current less than 4 mA is not displayed in r752[0...1] - but instead r752[0...1] = 4 mA is output.

<b>A03506 (F, N)</b>	<b>24 V power supply missing</b>
<b>Message class:</b>	Supply voltage fault (undervoltage) (3)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The 24 V power supply for the digital outputs (X124) is missing.
<b>Remedy:</b>	Check the terminals for the power supply voltage (X124, L1+, M).

---

<b>A03510 (F, N)</b>	<b>Calibration data not plausible</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	During booting, the calibration data for the analog inputs is read and checked with respect to plausibility. At least one calibration data point was determined to be invalid.
<b>Remedy:</b>	- switch off/switch on the power supply for the Control Unit. Note: If it reoccurs, then replace the module. In principle, operation could continue. The analog channel involved possibly does not achieve the specified accuracy.

---

<b>A03520 (F, N)</b>	<b>Temperature sensor fault</b>
<b>Message class:</b>	External measured value / signal state outside the permissible range (16)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	When evaluating the temperature sensor, an error occurred. It is expected that one of the following temperature sensors is connected via an analog input: - LG-Ni1000 (p0756[2...3] = 6) - PT1000 (p0756[2...3] = 7) - DIN Ni 1k (p0756[2...3] = 10) Alarm value (r2124, interpret decimal): 33: Analog input 2 (AI2) wire breakage or sensor not connected. 34: Analog input 2 (AI2) measured resistance too low (short circuit). 49: Analog input 3 (AI3) wire breakage or sensor not connected. 50: Analog input 3 (AI3) measured resistance too low (short circuit). See also: p0756 (CU analog inputs type)
<b>Remedy:</b>	- make sure that the sensor is connected correctly. - check the sensor for correct function and if required, replace. - change over the analog input to type "no sensor connected" (p0756 = 8).

<b>A03550</b>	<b>TM: Speed setpoint filter natural frequency &gt; Shannon frequency</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The natural filter frequency of the speed setpoint filter (p1417) is greater than or equal to the Shannon frequency. The Shannon frequency is calculated according to the following formula: $0.5 / p4099[3]$
<b>Remedy:</b>	Reduce the natural frequency of the speed setpoint filter (PT2 low pass) (p1417).

---

<b>A05000 (N)</b>	<b>Power unit: Overtemperature heat sink AC inverter</b>
<b>Message class:</b>	Power electronics faulted (5)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The alarm threshold for overtemperature at the inverter heat sink has been reached. The response is set using p0290. If the temperature of the heat sink increases by an additional 5 K, then fault F30004 is initiated.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

**Remedy:** Check the following:

- is the ambient temperature within the defined limit values?
- have the load conditions and the load duty cycle been appropriately dimensioned?
- has the cooling failed?

---

#### **A05001 (N) Power unit: Overtemperature depletion layer chip**

**Message class:** Power electronics faulted (5)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** Alarm threshold for overtemperature of the power semiconductor in the AC converter has been reached.

Note:

- the response is set using p0290.
- if the depletion layer temperature increases by an additional 15 K, then fault F30025 is triggered.

**Remedy:** Check the following:

- is the ambient temperature within the defined limit values?
- have the load conditions and the load duty cycle been appropriately dimensioned?
- has the cooling failed?
- pulse frequency too high?

#### **A05002 (N) Power unit: Air intake overtemperature**

**Message class:** Power electronics faulted (5)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** For chassis power units, the following applies:  
The alarm threshold for the air intake overtemperature has been reached. For air-cooled power units, the threshold is 42 °C (hysteresis 2 K). The response is set using p0290.  
If the air intake temperature increases by an additional 13 K, then fault F30035 is output.

**Remedy:** Check the following:

- is the ambient temperature within the defined limit values?
- has the fan failed? Check the direction of rotation.

---

#### **A05004 (N) Power unit: Rectifier overtemperature**

**Message class:** Power electronics faulted (5)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The alarm threshold for the overtemperature of the rectifier has been reached. The response is set using p0290.  
If the temperature of the rectifier increases by an additional 5 K, then fault F30037 is triggered.

**Remedy:** Check the following:

- is the ambient temperature within the defined limit values?
- have the load conditions and the load duty cycle been appropriately dimensioned?
- has the fan failed? Check the direction of rotation.
- has a phase of the line supply failed?
- is an arm of the supply (incoming) rectifier defective?

#### **A05006 (N) Power unit: Overtemperature thermal model**

**Message class:** Power electronics faulted (5)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The temperature difference between the chip and heat sink has exceeded the permissible limit value (blocksize power units only).  
Depending on p0290, an appropriate overload response is initiated.  
See also: r0037 (Power unit temperatures)

<b>Remedy:</b>	Not necessary. The alarm disappears automatically once the limit value is undershot. Note: If the alarm does not disappear automatically and the temperature continues to rise, this can result in fault F30024. See also: p0290 (Power unit overload response)
<b>A05065 (F, N)</b>	<b>Voltage measured values not plausible</b>
<b>Message class:</b>	Power electronics faulted (5)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The voltage measurement does not supply any plausible values and is not used. Alarm value (r2124, interpret bitwise binary): Bit 1: Phase U Bit 2: Phase V Bit 3: Phase W
<b>Remedy:</b>	The following parameterization must be made in order to de-activate the alarm: - De-activate voltage measurement (p0247.0 = 0). - De-activate flying restart with voltage measurement (p0247.5 = 0) and de-activate fast flying restart (p1780.11 = 0).

#### **F06310 (A) Supply voltage (p0210) incorrectly parameterized**

**Message class:** Network fault (2)

**Reaction:** NONE (OFF1, OFF2)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The measured DC voltage lies outside the tolerance range after precharging has been completed.

Permissible range:

$1.16 * p0210 < r0070 < 1.6 * p0210$

Note:

The fault can only be acknowledged when the drive is switched off.

See also: p0210 (Drive unit line supply voltage)

**Remedy:**

- check the parameterized supply voltage and if required change (p0210).
- check the line supply voltage.

#### **A06921 (N) Braking resistor phase unsymmetry**

**Message class:** Braking Module faulted (14)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:**

- the three resistors of the braking chopper are not symmetrical.
- DC link voltage oscillations caused by fluctuating loads of the connected drives.

**Remedy:**

- check the feeder cables to the braking resistors.
- if required, increase the value for detecting dissymmetry (p1364).

---

#### **F06922 Braking resistor phase failure**

**Message class:** Braking Module faulted (14)

#### **F07011 Drive: Motor overtemperature**

**Message class:** Motor overload (8)

**Reaction:** OFF2 (NONE, OFF1, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** KTY84/PT1000:

The motor temperature has exceeded the fault threshold (p0605) or the timer (p0606) after the alarm threshold was exceeded (p0604) has expired. The response parameterized in p0610 becomes active. The alarm is withdrawn if the response threshold for wire breakage or sensor not connected is exceeded ( $R > 2120 \text{ Ohm}$ ).

PTC or bimetallic NC contact:

The response threshold of 1650 Ohm was exceeded or the NC contact opened and the timer (p0606) has expired. The response parameterized in p0610 becomes active.

Possible causes:

- motor is overloaded.
- motor ambient temperature too high.
- wire breakage or sensor not connected.

Fault value (r0949, interpret decimal):

200:

The motor temperature model 1 (I2t) signals an overtemperature (p0612.0 = 1, p0611 > 0, p0615 reached).

See also: p0604, p0605, p0606, p0612, p0613, p0625, p0626, p0627, p0628

**Remedy:**

- reduce the motor load.
  - check the ambient temperature and the motor ventilation.
  - check the wiring and the connection of the PTC or bimetallic NC contact.
- See also: p0604, p0605, p0606, p0612, p0625, p0626, p0627, p0628

**Remedy:**

- check the motor load and if required, reduce.
  - check the motor ambient temperature.
  - check activation of the motor temperature model (p0612).
- Motor temperature model 1 (I2t):
- check the thermal time constant (p0611).
  - check the alarm threshold (p0605).
- Motor temperature model 3:
- check the motor type.
  - check the alarm threshold (p5398).
  - check the model parameters.

<b>F07082</b>	<b>Macro: Execution not possible</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The macro cannot be executed. Fault value (r0949, interpret hexadecimal): ccccbbaa hex: cccc = preliminary parameter number, bb = supplementary information, aa = fault cause Fault causes for the trigger parameter itself: 19: Called file is not valid for the trigger parameter. 20: Called file is not valid for parameter 15.

- 21: Called file is not valid for parameter 700.
  - 22: Called file is not valid for parameter 1000.
  - 23: Called file is not valid for parameter 1500.
  - 24: Data type of a TAG is incorrect (e.g. Index, number or bit is not U16).
- Fault causes for the parameters to be set:
- 25: Error level has an undefined value.
  - 26: Mode has an undefined value.
  - 27: A value was entered as string in the tag value that is not "DEFAULT".
  - 31: Entered drive object type unknown.
  - 32: A device was not able to be found for the determined drive object number.
  - 34: A trigger parameter was recursively called.
  - 35: It is not permissible to write to the parameter via macro.
  - 36: Check, writing to a parameter unsuccessful, parameter can only be read, not available, incorrect data type, value range or assignment incorrect.
  - 37: Source parameter for a BICO interconnection was not able to be determined.
  - 38: An index was set for a non-indexed (or CDS-dependent) parameter.
  - 39: No index was set for an indexed parameter.
  - 41: A bit operation is only permissible for parameters with the parameter format DISPLAY\_BIN.

**F07083 Macro: ACX file not found**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** The ACX file (macro) to be executed was not able to be found in the appropriate directory.  
Fault value (r0949, interpret decimal):  
Parameter number with which the execution was started.  
See also: p0015, p1000, p1500

**Remedy:** - check whether the file is saved in the appropriate directory on the memory card.

---

**F07084 Macro: Condition for WaitUntil not fulfilled**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** The WaitUntil condition set in the macro was not fulfilled in a certain number of attempts.  
Fault value (r0949, interpret decimal):  
Parameter number for which the condition was set.

**Remedy:** Check and correct the conditions for the WaitUntil loop.

---

**F07086 Units changeover: Parameter limit violation due to reference value change**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** A reference parameter was changed in the system. This resulted in the fact that for the parameters involved, the selected value was not able to be written in the per unit notation.  
The values of the parameters were set to the corresponding violated minimum limit/maximum limit or to the factory setting.  
Possible causes:  
- the steady-state minimum limit/maximum limit or that defined in the application was violated.

## 4 Faults and alarms

### 4.2 List of faults and alarms

Fault value (r0949, parameter):

Diagnostics parameter to display the parameters that were not able to be re-calculated.

See also: p0304, p0305, p0310, p0596, p2000, p2001, p2002, p2003, r2004

**Remedy:** Check the adapted parameter value and if required correct.

---

#### F07088

#### **Units changeover: Parameter limit violation due to units changeover**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** A changeover of units was initiated. This resulted in a violation of a parameter limit

Possible causes for the violation of a parameter limit:

- When rounding off a parameter corresponding to its decimal places, the steady-state minimum limit or maximum limit was violated.

- inaccuracies for the data type "FloatingPoint".

In these cases, when the minimum limit is violated then the parameter value is rounded up and when the maximum limited is violated the parameter value is rounded down.

Fault value (r0949, interpret decimal):

Diagnostics parameter r9451 to display all parameters whose value had to be adapted.

See also: p0100 (IEC/NEMA mot stds), p0505 (Selecting the system of units), p0595 (Technological unit selection)

**Remedy:** Check the adapted parameter values and if required correct.

See also: r9451 (Units changeover adapted parameters)

---

#### A07089

#### **Changing over units: Function module activation is blocked because the units have been changed over**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** An attempt was made to activate a function module. This is not permissible if the units have already been changed over.

See also: p0100 (IEC/NEMA mot stds), p0505 (Selecting the system of units)

**Remedy:** Restore units that have been changed over to the factory setting.

---

#### A07092

#### **Drive: moment of inertia estimator still not ready**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The moment of inertia estimator still has no valid values.

The acceleration cannot be calculated.

The moment of inertia estimator is ready, if the frictional values (p1563, p1564) as well as the moment of inertia value (p1493) have been determined (r1407.26 = 1).

**Remedy:** Repeat the operation when the moment of inertia estimator is ready (r1407.26 = 1).

---

#### A07094

#### **General parameter limit violation**

**Message class:** Hardware/software error (1)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** As a result of the violation of a parameter limit, the parameter value was automatically corrected.

Minimum limit violated --> parameter is set to the minimum value.

Maximum limit violated --> parameter is set to the maximum value.

Alarm value (r2124, interpret decimal):

Parameter number, whose value had to be adapted.

**Remedy:** Check the adapted parameter values and if required correct.

---

<b>A07200</b>	<b>Drive: Master control ON command present</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The ON/OFF1 command is present (no 0 signal). The command is either influenced via binector input p0840 (current CDS) or control word bit 0 via the master control.
<b>Remedy:</b>	Switch the signal via binector input p0840 (current CDS) or control word bit 0 via the master control to 0.

---

<b>F07220 (N, A)</b>	<b>Drive: Master control by PLC missing</b>
<b>Message class:</b>	Communication error to the higher-level control system (9)
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3, STOP2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The "master control by PLC" signal was missing in operation. - interconnection of the binector input for "master control by PLC" is incorrect (p0854). - the higher-level control has withdrawn the "master control by PLC" signal. - data transfer via the fieldbus (master/drive) was interrupted.
<b>Remedy:</b>	- check the interconnection of the binector input for "master control by PLC" (p0854). - check the "master control by PLC" signal and, if required, switch in. - check the data transfer via the fieldbus (master/drive). Note: If the drive should continue to operate after withdrawing "master control by PLC" then fault response must be parameterized to NONE or the message type should be parameterized as alarm.

---

<b>F07300 (A)</b>	<b>Drive: Line contactor feedback signal missing</b>
<b>Message class:</b>	Auxiliary unit faulted (20)
<b>Reaction:</b>	OFF2 (NONE)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	- the line contactor was not able to be closed within the time in p0861. - the line contactor was not able to be opened within the time in p0861. - the line contactor dropped out during operation - the line contactor has closed although the drive converter is switched off.
<b>Remedy:</b>	- check the setting of p0860. - check the feedback circuit from the line contactor. - increase the monitoring time in p0861. See also: p0860 (Line contactor feedback signal), p0861 (Line contactor monitoring time)

---

<b>F07320</b>	<b>Drive: Automatic restart interrupted</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	- the specified number of restart attempts (p1211) has been completely used up because within the monitoring time (p1213) the faults were not able to be acknowledged. The number of restart attempts (p1211) is decremented at each new start attempt. - the monitoring time for the power unit has expired (p0857). - when exiting commissioning or at the end of the motor identification routine or the speed controller optimization, the drive unit is not automatically switched on again. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- increase the number of restart attempts (p1211). The actual number of starting attempts is displayed in r1214. - increase the delay time in p1212 and/or the monitoring time in p1213. - either increase or disable the monitoring time of the power unit (p0857). - reduce the delay time to reset the start counter (p1213[1]) so that fewer faults are registered in the time interval.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

<b>A07321</b>	<b>Drive: Automatic restart active</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The automatic restart (AR) is active. When the line supply returns and/or the causes of the existing faults are removed the drive is automatically restarted. The pulses are enabled and the motor starts to rotate. For p1210 = 26, restarting is realized with the delayed setting of the ON command.
<b>Remedy:</b>	- the automatic restart (AR) should, if required, be inhibited (p1210 = 0). - an automatic restart can be directly interrupted by withdrawing the switch-on command (BI: p0840). - for p1210 = 26: by withdrawing the OFF2- / OFF3 command.

---

<b>F07330</b>	<b>Flying restart: Measured search current too low</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF2 (NONE, OFF1)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	During a flying restart, it was identified that the search current reached is too low. It is possible that the motor is not connected.
<b>Remedy:</b>	Check the motor feeder cables.

---

<b>F07331</b>	<b>Flying restart: Function not supported</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF2 (NONE, OFF1)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	It is not possible to power up with the motor rotating (no flying restart). In the following cases, the "flying restart" function is not supported: PMSM: operation with U/f characteristic and sensorless vector control. Note: PMSM: permanent-magnet synchronous motor
<b>Remedy:</b>	De-activate the "flying restart" function (p1200 = 0).

---

<b>A07350 (F)</b>	<b>Drive: Measuring probe parameterized to a digital output</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The measuring probe is connected to a bi-directional digital input/output and the terminal is set as output. Alarm value (r2124, interpret decimal): 8: DI/DO 8 (X122.9/X132.1) 9: DI/DO 9 (X122.10/X132.2) 10: DI/DO 10 (X122.12/X132.3) 11: DI/DO 11 (X122.13/X132.4) 12: DI/DO 12 (X132.9) 13: DI/DO 13 (X132.10) 14: DI/DO 14 (X132.12) 15: DI/DO 15 (X132.13) To the terminal designation: The first designation is valid for CU320, the second for CU305.
<b>Remedy:</b>	- set the terminal as input (p0728). - de-select the measuring probe (p0488, p0489, p0580).

<b>A07400 (N)</b>	<b>Drive: DC link voltage maximum controller active</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The DC link voltage controller has been activated because the upper switch-in threshold has been exceeded (r1242, r1282). The ramp-down times are automatically increased in order to maintain the DC link voltage (r0070) within the permissible limits. There is a system deviation between the setpoint and actual speeds. When the DC link voltage controller is switched out (disabled), this is the reason that the ramp-function generator output is set to the speed actual value. See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller configuration (vector control)), p1280 (Vdc controller configuration (U/f))
<b>Remedy:</b>	If the controller is not to intervene: - increase the ramp-down times. - switch off the Vdc_max controller (p1240 = 0 for vector control, p1280 = 0 for U/f control). If the ramp-down times are not to be changed: - use a chopper or regenerative feedback unit.
<b>A07401 (N)</b>	<b>Drive: DC link voltage maximum controller de-activated</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The Vdc_max controller can no longer maintain the DC link voltage (r0070) below the limit value (r1242, r1282) and was therefore switched out (disabled). - the line supply voltage is permanently higher than specified for the power unit. - the motor is permanently in the regenerative mode as a result of a load that is driving the motor.
<b>Remedy:</b>	- check whether the input voltage is within the permissible range (if required, increase the value in p0210). - check whether the load duty cycle and load limits are within the permissible limits.
<b>A07402 (N)</b>	<b>Drive: DC link voltage minimum controller active</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The DC link voltage controller has been activated as the lower switch-in threshold has been undershot (r1246, r1286). The kinetic energy of the motor is used to buffer the DC link. The drive is therefore braked. See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller configuration (vector control)), p1280 (Vdc controller configuration (U/f))
<b>Remedy:</b>	The alarm disappears when power supply returns.
<b>F07404</b>	<b>Drive: DC link voltage monitoring Vdc_max</b>
<b>Message class:</b>	DC-link overvoltage (4)
<b>Reaction:</b>	OFF2 (NONE, OFF1, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The monitoring of the DC link voltage p1284 has responded (only U/f control).
<b>Remedy:</b>	- check the line supply voltage. - check the braking module. - adapt the device supply voltage (p0210). - adapt the DC link voltage monitoring (p1284).
<b>F07405 (N, A)</b>	<b>Drive: Kinetic buffering minimum speed fallen below</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	During kinetic buffering the speed fell below minimum speed (p1257 or p1297 for vector drives with U/f control) and the line supply did not return.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:** Check the speed threshold for the Vdc\_min controller (kinetic buffering) (p1257, p1297).  
See also: p1257 (Vdc\_min controller speed threshold), p1297 (Vdc\_min controller speed threshold (U/f))

**F07406 (N, A) Drive: Kinetic buffering maximum time exceeded**  
**Message class:** Application/technological function faulted (17)  
**Reaction:** OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)  
**Acknowledge:** IMMEDIATELY  
**Cause:** The maximum buffer time (p1255 and p1295 for vector drives with U/f control) has been exceeded without the line supply having returned.  
**Remedy:** Check the time threshold for Vdc-min controller (kinetic buffering) (p1255, p1295).  
See also: p1255 (Vdc\_min controller time threshold), p1295 (Vdc\_min controller time threshold (U/f))

---

**A07409 (N) Drive: U/f control, current limiting controller active**  
**Message class:** Application/technological function faulted (17)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The current limiting controller of the U/f control was activated because the current limit was exceeded.  
**Remedy:** The alarm is automatically withdrawn after one of the following measures:  
- increase current limit (p0640).  
- reduce the load.  
- slow down the ramp up to the setpoint speed.

---

**F07410 Drive: Current controller output limited**  
**Message class:** Application/technological function faulted (17)  
**Reaction:** OFF2 (NONE, OFF1)  
**Acknowledge:** IMMEDIATELY  
**Cause:** The condition " $I_{act} = 0$  and  $U_{q\_set\_1}$  longer than 16 ms at its limit" is present and can be caused by the following:  
- motor not connected or motor contactor open.  
- motor data and motor configuration (star-delta) do not match.  
- no DC link voltage present.  
- power unit defective.  
- the "flying restart" function is not activated.  
**Remedy:**  
- connect the motor or check the motor contactor.  
- check the motor parameterization and the connection type (star-delta).  
- check the DC link voltage (r0070).  
- check the power unit.  
- activate the "flying restart" function (p1200).

---

**F07411 Drive: Flux setpoint not reached when building up excitation**  
**Message class:** Application/technological function faulted (17)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** When quick magnetizing is configured (p1401.6 = 1) the specified flux setpoint is not reached although 90% of the maximum current is specified.  
- incorrect motor data.  
- motor data and motor configuration (star-delta) do not match.  
- the current limit has been set too low for the motor.  
- induction motor (encoderless, open-loop controlled) in I2t limiting.  
- power unit is too small.  
- the magnetizing time is too short.

- Remedy:**
- correct the motor data. Perform motor data identification and rotating measurement.
  - check the motor configuration.
  - correct the current limits (p0640).
  - reduce the induction motor load.
  - if necessary, use a larger power unit.
  - check motor supply cable.
  - check power unit.
  - increase p0346.

**A07416 Drive: Flux controller configuration**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The configuration of the flux control (p1401) is contradictory.  
Alarm value (r2124, interpret hexadecimal):  
ccbbaaaa hex  
aaaa = Parameter  
bb = Index  
cc = fault cause  
1: Quick magnetizing (p1401.6) for soft starting (p1401.0).  
2: Quick magnetizing for flux build-up control (p1401.2).  
3: Quick magnetizing (p1401.6) for Rs identification after restart (p0621 = 2).

- Remedy:**
- For fault cause = 1:
- Shut down soft start (p1401.0 = 0).
  - Shut down quick magnetizing (p1401.6 = 0).
- For fault cause = 2:
- De-energize flux build-up control (p1401.2 = 0).
  - Shut down quick magnetizing (p1401.6 = 0).
- For fault cause = 3:
- Re-parameterize Rs identification (p0621 = 0, 1)
  - Shut down quick magnetizing (p1401.6 = 0).

**F07426 (A) Technology controller actual value limited**

**Message class:** Application/technological function faulted (17)

**Reaction:** OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** The actual value for the technology controller, interconnected via connector input p2264, has reached a limit.  
Fault value (r0949, interpret decimal):  
1: upper limit reached.  
2: lower limit reached.

**Remedy:**

- adapt the limits to the signal level (p2267, p2268).
- check the actual value normalization (p0595, p0596).

**A07428 (N) Technology controller parameterizing error**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The technology controller has a parameterizing error.  
Alarm value (r2124, interpret decimal):  
1:  
The upper output limit in p2291 is set lower than the lower output limit in p2292.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:** For alarm value = 1:  
Set the output limit in p2291 higher than in p2292.  
See also: p2291 (Technology controller maximum limiting), p2292 (Technology controller minimum limiting)

**F07435 (N)**      **Drive: Setting the ramp-function generator for sensorless vector control**  
**Message class:** Application/technological function faulted (17)  
**Reaction:** OFF2 (IASC/DCBRK, NONE, OFF1, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** During operation with sensorless vector control (r1407.1) the ramp-function generator was stopped (p1141). An internal setting command of the ramp-function generator output caused the set setpoint speed to be frozen.  
**Remedy:** - de-activate the holding command for the ramp-function generator (p1141).  
- suppress the fault (p2101, p2119). This is necessary if the ramp-function generator is held using jogging and the speed setpoint is simultaneously inhibited (r0898.6).

---

**A07440**      **EPOS: Jerk time is limited**  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The calculation of the jerk time  $T_r = \max(p2572, p2573) / p2574$  resulted in an excessively high value so that the jerk time is internally limited to 1000 ms.  
**Note:**  
The alarm is also output if jerk limiting is not active.  
**Remedy:** - increase the jerk limiting (p2574).  
- reduce maximum acceleration or maximum deceleration (p2572, p2573).  
See also: p2572 (EPOS maximum acceleration), p2573 (EPOS maximum deceleration), p2574 (EPOS jerk limiting)

**A07441**      **LR: Save the position offset of the absolute encoder adjustment**  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The status of the absolute encoder adjustment has changed.  
In order to permanently save the determined position offset (p2525) it must be saved in a non-volatile fashion (p0971).  
**Remedy:** Not necessary.  
This alarm automatically disappears after the offset has been saved.  
See also: p2507 (LR absolute encoder adjustment status), p2525 (LR encoder adjustment offset)

---

**F07442 (A)**      **LR: Multiturn does not match the modulo range**  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** OFF1 (OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** The ratio between the multiturn resolution and the modulo range (p2576) is not an integer number.  
This results in the adjustment being set back, as the position actual value cannot be reproduced after switch-off/switch-on.  
**Remedy:** Make the ration between the multiturn resolution and the modulo range an integer number.  
The ratio  $v$  is calculated as follows:  
1. Motor encoder  
$$v = (p0421 * p2506 * p2505) / (p2504 * p2576)$$
  
2. Direct encoder  
$$v = (p0421 * p2506) / p2576$$

<b>F07450 (A)</b>	<b>LR: Standstill monitoring has responded</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF1 (OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	After the standstill monitoring time (p2543) expired, the drive left the standstill window (p2542). - position actual value inversion incorrectly set (p0410). - standstill window set too small (p2542). - standstill monitoring time set too low (p2543). - position loop gain too low (p2538). - position loop gain too high (instability/oscillation, p2538). - mechanical overload. - Connecting cable, motor/drive converter incorrect (phase missing, interchanged). - when selecting motor identification, select tracking mode (BI: p2655[0] = 1 signal). - when selecting function generator, select tracking mode (BI: p2655[0] = 1 signal) and de-activate position control (BI:p2550 = 0 signal).

<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF1 (OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	When the position monitoring time (p2545) expired, the drive had still not reached the positioning window (p2544). - positioning window parameterized too small (p2544). - position monitoring time parameterized too short (p2545). - position loop gain too low (p2538). - position loop gain too high (instability/oscillation, p2538). - drive mechanically locked.
<b>Remedy:</b>	Check the causes and resolve.

---

<b>F07452 (A)</b>	<b>LR: Following error too high</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF1 (OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The difference between the position setpoint position actual value (following error dynamic model, r2563) is higher than the tolerance (p2546). - the drive torque or accelerating capacity exceeded. - position measuring system fault. - encoder cable interrupted. - position control sense incorrect. - mechanical system locked. - excessively high traversing velocity or excessively high position reference value (setpoint) differences
<b>Remedy:</b>	Check the causes and resolve.

---

<b>A07454</b>	<b>LR: Position actual value preprocessing does not have a valid encoder</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	One of the following problems has occurred with the position actual value preprocessing: - an encoder is not assigned for the position actual value preprocessing (p2502 = 0). - an encoder is assigned, but no encoder data set (p0187 = 99 or p0188 = 99). - an encoder an an encoder data set have been assigned, however, the encoder data set does not contain any encoder data (p0400 = 0) or invalid data (e.g. p0408 = 0).

---

<b>A07455</b>	<b>EPOS: Maximum velocity limited</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The maximum velocity (p2571) is too high to correctly calculate the modulo correction. Within the sampling time for positioning (8 ms), with the maximum velocity, a maximum of the half modulo length must be moved through. p2571 was limited to this value.
<b>Remedy:</b>	Reduce the maximum velocity (p2571).

---

<b>A07456</b>	<b>EPOS: Setpoint velocity limited</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The actual setpoint velocity is greater than the parameterized maximum velocity (p2571) and is therefore limited.
<b>Remedy:</b>	- check the entered setpoint velocity. - reduce the velocity override (CI: p2646). - increase the maximum velocity (p2571). - check the signal source for the externally limited velocity (CI: p2594).

---

<b>A07457</b>	<b>EPOS: Combination of input signals illegal</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	An illegal combination of input signals that are simultaneously set was identified. Alarm value (r2124, interpret decimal): 0: Jog 1 and jog 2 (p2589, p2590). 1: Jog 1 or jog 2 and direct setpoint input/MDI (p2589, p2590, p2647). 2: Jog 1 or jog 2 and start referencing (p2589, p2590, p2595). 3: Jog 1 or jog 2 and activate traversing task (p2589, p2590, p2631). 4: Direct setpoint input/MDI and starting referencing (p2647, p2595). 5: Direct setpoint input/MDI and activate traversing task (p2647, p2631). 6: Start referencing and activate traversing task (p2595, p2631).
<b>Remedy:</b>	Check the appropriate input signals and correct.

---

<b>A07463 (F)</b>	<b>EPOS: External block change not requested in the traversing block</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	For a traversing block with the block change enable CONTINUE_EXTERNAL_ALARM, the external block change was not requested. Alarm value (r2124, interpret decimal): Number of the traversing block.
<b>Remedy:</b>	Resolve the reason as to why the edge is missing at binector input (BI: p2632).

---

<b>F07464</b>	<b>EPOS: Traversing block is inconsistent</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF1 (OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The traversing block does not contain valid information. Fault value (r0949, interpret decimal): Number of the traversing block with invalid information.
<b>Remedy:</b>	Check the traversing block and where relevant, take into consideration alarms that are present.

---

<b>A07465</b>	<b>EPOS: Traversing block does not have a subsequent block</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	There is no subsequent block in the traversing block. Alarm value (r2124, interpret decimal): Number of the traversing block with the missing subsequent block.
<b>Remedy:</b>	- parameterize this traversing block with the block change enable END. - parameterize additional traversing blocks with a higher block number and for the last block, using the block change enable END.

---

<b>A07466</b>	<b>EPOS: Traversing block number assigned a multiple number of times</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The same traversing block number was assigned a multiple number of times. Alarm value (r2124, interpret decimal): Number of the traversing block that was assigned a multiple number of times.
<b>Remedy:</b>	Correct the traversing blocks.

---

<b>A07467</b>	<b>EPOS: Traversing block has illegal task parameters</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The task parameter in the traversing block contains an illegal value. Alarm value (r2124, interpret decimal): Number of the traversing block with an illegal task parameter.
<b>Remedy:</b>	Correct the task parameter in the traversing block.

---

<b>A07468</b>	<b>EPOS: Traversing block jump destination does not exist</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	In a traversing block, a jump was programmed to a non-existent block. Alarm value (r2124, interpret decimal): Number of the traversing block with a jump destination that does not exist.

**Remedy:**

- correct the traversing block.
- add the missing traversing block.

---

**A07469**      **EPOS: Traversing block < target position < software limit switch minus**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** In the traversing block the specified absolute target position lies outside the range limited by the software limit switch minus.  
Alarm value (r2124, interpret decimal):  
Number of the traversing block with illegal target position.

**Remedy:**

- correct the traversing block.
- change software limit switch minus (CI: p2578, p2580).

---

**A07470**      **EPOS: Traversing block > target position > software limit switch plus**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** In the traversing block the specified absolute target position lies outside the range limited by the software limit switch plus.  
Alarm value (r2124, interpret decimal):  
Number of the traversing block with illegal target position.

**Remedy:**

- correct the traversing block.
- change software limit switch plus (CI: p2579, p2581).

---

**A07471**      **EPOS: Traversing block target position outside the modulo range**

**Message class:** Application/technological function faulted (17)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** In the traversing block the target position lies outside the modulo range.  
Alarm value (r2124, interpret decimal):  
Number of the traversing block with illegal target position.

**Remedy:**

- in the traversing block, correct the target position.
- change the modulo range (p2576).

---

**A07472**      **EPOS: Traversing block ABS\_POS/ABS\_NEG not possible**

**Message class:** Application/technological function faulted (17)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** In the traversing block the positioning mode ABS\_POS or ABS\_NEG were parameterized with the modulo correction not activated.  
Alarm value (r2124, interpret decimal):  
Number of the traversing block with the illegal positioning mode.

**Remedy:** Correct the traversing block.

---

**A07473 (F)**      **EPOS: Beginning of traversing range reached**

**Message class:** Application/technological function faulted (17)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** When traversing, the axis has moved to the traversing range limit.

**Remedy:** Move away in the positive direction.

---

<b>A07474 (F)</b>	<b>EPOS: End of traversing range reached</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	When traversing, the axis has moved to the traversing range limit.
<b>Remedy:</b>	Move away in the negative direction.

---

<b>F07475 (A)</b>	<b>EPOS: Target position &lt; start of traversing range</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF1 (OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The target position for relative traversing lies outside the traversing range.
<b>Remedy:</b>	Correct the target position.

---

<b>F07476 (A)</b>	<b>EPOS: Target position &gt; end of the traversing range</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF1 (OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The target position for relative traversing lies outside the traversing range.
<b>Remedy:</b>	Correct the target position.

---

<b>A07477 (F)</b>	<b>EPOS: Target position &lt; software limit switch minus</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	In the actual traversing operation, the target position is less than the software limit switch minus.
<b>Remedy:</b>	- correct the target position. - change software limit switch minus (CI: p2578, p2580). See also: p2578 (EPOS software limit switch minus signal source), p2580 (EPOS software limit switch minus), p2582 (EPOS software limit switch activation)

---

<b>A07478 (F)</b>	<b>EPOS: Target position &gt; software limit switch plus</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	In the actual traversing operation, the target position is greater than the software limit switch plus.
<b>Remedy:</b>	- correct the target position. - change software limit switch plus (CI: p2579, p2581). See also: p2579 (EPOS software limit switch plus signal source), p2581 (EPOS software limit switch plus), p2582 (EPOS software limit switch activation)

---

<b>A07479</b>	<b>EPOS: Software limit switch minus reached</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The axis is at the position of the software limit switch minus. An active traversing block was interrupted.
<b>Remedy:</b>	- correct the target position. - change software limit switch minus (CI: p2578, p2580). See also: p2578 (EPOS software limit switch minus signal source), p2580 (EPOS software limit switch minus), p2582 (EPOS software limit switch activation)

---

<b>A07480</b>	<b>EPOS: Software limit switch plus reached</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The axis is at the position of the software limit switch plus. An active traversing block was interrupted.

**Remedy:**

- correct the target position.
- change software limit switch plus (CI: p2579, p2581).

See also: p2579 (EPOS software limit switch plus signal source), p2581 (EPOS software limit switch plus), p2582 (EPOS software limit switch activation)

---

**F07481 (A) EPOS: Axis position < software limit switch minus**

**Message class:** Application/technological function faulted (17)  
**Reaction:** OFF1 (OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** The actual position of the axis is less than the position of the software limit switch minus.  
**Remedy:**

- correct the target position.
- change software limit switch minus (CI: p2578, p2580).

See also: p2578 (EPOS software limit switch minus signal source), p2580 (EPOS software limit switch minus), p2582 (EPOS software limit switch activation)

---

**F07482 (A) EPOS: Axis position > software limit switch plus**

**Message class:** Application/technological function faulted (17)  
**Reaction:** OFF1 (OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** The actual position of the axis is greater than the position of the software limit switch plus.  
**Remedy:**

- correct the target position.
- change software limit switch plus (CI: p2579, p2581).

See also: p2579 (EPOS software limit switch plus signal source), p2581 (EPOS software limit switch plus), p2582 (EPOS software limit switch activation)

---

**A07483 EPOS: Travel to fixed stop clamping torque not reached**

**Message class:** Application/technological function faulted (17)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The fixed stop in the traversing block was reached without the clamping torque/clamping force having been achieved.  
**Remedy:**

- check the maximum torque-generating current (r1533).
- check the torque limits (p1520, p1521).
- check the power limits (p1530, p1531).
- check the BICO interconnections of the torque limits (p1522, p1523, p1528, p1529).

---

**F07484 EPOS: Fixed stop outside the monitoring window**

**Message class:** Application/technological function faulted (17)  
**Reaction:** OFF3 (OFF1, OFF2)  
**Acknowledge:** IMMEDIATELY  
**Cause:** In the "fixed stop reached" state, the axis has moved outside the defined monitoring window (p2635).  
**Remedy:**

- check the monitoring window (p2635).
- check the mechanical system.

---

**F07485 (A) EPOS: Fixed stop not reached**

**Message class:** Application/technological function faulted (17)  
**Reaction:** OFF1 (OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** In a traversing block with the task FIXED STOP, the end position was reached without detecting a fixed stop.  
**Remedy:**

- check the traversing block and locate the target position further into the workpiece.
- check the "fixed stop reached" control signal (p2637).
- if required, reduce the maximum following error window to detect the fixed stop (p2634).

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

<b>A07486</b>	<b>EPOS: Intermediate stop missing</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	In the modes "traversing blocks" or "direct setpoint input/MDI" at the start of motion, the binector input "no intermediate stop/intermediate stop" (BI: p2640) did not have a 1 signal.
<b>Remedy:</b>	Connect a 1 signal to the binector input "no intermediate stop/intermediate stop" (BI: p2640) and re-start motion. See also: p2640 (EPOS intermediate stop (0 signal))

---

<b>A07487</b>	<b>EPOS: Reject traversing task missing</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	In the modes "traversing blocks" or "direct setpoint input/MDI" at the start of motion, the binector input "do not reject traversing task/reject traversing task" (BI: p2641) does not have a 1 signal.
<b>Remedy:</b>	Connect a 1 signal to the binector input "do not reject traversing task/reject traversing task" (BI: p2641) and restart motion. See also: p2641 (EPOS reject traversing task (0 signal))

---

<b>F07488</b>	<b>EPOS: Relative positioning not possible</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF1 (OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	In the mode "direct setpoint input/MDI", for continuous transfer (p2649 = 1) relative positioning was selected (BI: p2648 = 0 signal).
<b>Remedy:</b>	Check the control.

---

<b>A07489</b>	<b>EPOS: Reference point correction outside the window</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	For the function "flying referencing" the difference between the measured position at the measuring probe and the reference point coordinate lies outside the parameterized window.
<b>Remedy:</b>	- check the mechanical system. - check the parameterization of the window (p2602).

---

<b>F07490 (N)</b>	<b>EPOS: Enable signal withdrawn while traversing</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF1 (OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	- for a standard assignment, another fault may have occurred as a result of withdrawing the enable signals. - the drive is in the "switching-on inhibited" state (for a standard assignment).
<b>Remedy:</b>	- set the enable signals or check the cause of the fault that first occurred and then result (for a standard assignment). - check the assignment to enable the basic positioning function.

---

<b>F07491 (A)</b>	<b>EPOS: STOP cam minus reached</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF3
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A 0 signal was detected at binector input BI: p2569, i.e. the STOP cam minus was reached. For a positive traversing direction, the STOP cam minus was reached - i.e. the wiring of the STOP cam is incorrect. See also: p2569 (EPOS STOP cam minus)
<b>Remedy:</b>	- leave the STOP cam minus in the positive traversing direction and return the axis to the valid traversing range. - check the wiring of the STOP cam.

---

---

<b>F07492 (A)</b>	<b>EPOS: STOP cam plus reached</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF3
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A 0 signal was detected at binector input BI: p2570, i.e. the STOP cam plus was reached. For a negative traversing direction, the STOP cam plus was reached - i.e. the wiring of the STOP cam is incorrect. See also: p2570 (EPOS STOP cam plus)
<b>Remedy:</b>	- leave the STOP cam plus in the negative traversing direction and return the axis to the valid traversing range. - check the wiring of the STOP cam.

---

<b>F07493</b>	<b>LR: Overflow of the value range for position actual value</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF1 (OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The value range (-2147483648 ... 2147483647) for the position actual value representation was exceeded. When the overflow occurs, the "referenced" or "adjustment absolute measuring system" status is reset. Fault value (r0949, interpret decimal): 1: The position actual value (r2521) has exceeded the value range. 2: The encoder position actual value Gn_XIST2 (r0483) or the absolute value after the load gear (r2723) has exceeded the value range. 3: The maximum encoder value times the factor to convert the absolute position (r0483 and/or r2723) from increments to length units (LU) has exceeded the value range for displaying the position actual value. Note: For a linear encoder, the following must be maintained: - $p0407 * p2503 / (2^{p0418} * 10^7) < 1$ - $p0407 * p2503 / (2^{p0419} * 10^7) < 1$
<b>Remedy:</b>	If required, reduce the traversing range or position resolution (p2506). Increase the fine resolution of absolute position actual value (p0419). Note for fault value = 3: If the value for the maximum possible absolute position (LU) is greater than 4294967296, then it is not possible to make an adjustment due to an overflow. For rotary encoders, the maximum possible absolute position (LU) is calculated as follows: 1. Motor encoder $p2506 * p2505 / p2504$ $p2506 * p2505 * p0421 / p2504$ for multiturn encoders 2. Direct encoder $p2506$ $p2506 * p0421$ for multiturn encoders

---

<b>F07494</b>	<b>LR: Drive Data Set changeover in operation</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF1 (OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A Drive Data Set changeover (DDS) with a change of the mechanical relationships (p2503 ... 2506), direction of rotation (p1821) or the encoder assignment (p2502) was requested in operation. Note: DDS: Drive Data Set
<b>Remedy:</b>	To changeover the drive data set, initially, exit the "operation" mode.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

<b>A07495 (F)</b>	<b>LR: Reference function interrupted</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	An activated reference function (reference mark search or measuring probe evaluation) was interrupted. Possible causes: <ul style="list-style-type: none"><li>- an encoder fault has occurred (Gn_ZSW.15 = 1).</li><li>- position actual value was set during an activated reference function.</li><li>- simultaneously activate reference mark search and measuring probe evaluation (BI: p2508 and BI: p2509 = 1 signal).</li><li>- activated reference function (reference mark search or measuring probe evaluation) was de-activated (BI: p2508 and BI: p2509 = 0 signal).</li><li>- the input terminal for the measuring probe is not set.</li></ul>
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- check the causes and resolve.</li><li>- reset the control (BI: p2508 and BI: p2509 = 0 signal) and activate the requested function.</li><li>- set the input terminal for the measuring probe (p0488, p0489 or p2517, p2518).</li></ul>

---

<b>A07496</b>	<b>EPOS: Enable not possible</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	It is not possible to enable the basic positioner because at least one signal is missing. Alarm value (r2124, interpret decimal): <ul style="list-style-type: none"><li>1: EPOS enable missing (BI: p2656).</li><li>2: Position actual value, valid feedback signal missing (BI: p2658).</li></ul> See also: p2656 (EPOS enable basic positioner), p2658 (EPOS pos. actual value valid feedback signal)
<b>Remedy:</b>	Check the appropriate binector inputs and signals.

---

<b>A07497 (N)</b>	<b>LR: Position setting value activated</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The position actual value is set to the value received via CI: p2515 while BI: p2514 = 1 signal. A possible system deviation cannot be corrected.
<b>Remedy:</b>	Not necessary. The alarm automatically disappears with BI: p2514 = 0 signal.

---

<b>A07498 (F)</b>	<b>LR: Measuring probe evaluation not possible</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	When evaluating the measuring probe, an error occurred. Alarm value (r2124, interpret decimal): <ul style="list-style-type: none"><li>6: The input terminal for the measuring probe is not set.</li><li>4098: Error when initializing the measuring probe.</li><li>4100: The measuring pulse frequency is too high.</li><li>&gt; 50000: The measuring clock cycle is not a multiple integer of the position controller clock cycle.</li></ul>
<b>Remedy:</b>	De-activate the measuring probe evaluation (BI: p2509 = 0 signal). For alarm value = 6: Set the input terminal for the measuring probe (p0488, p0489 or p2517, p2518).

For alarm value = 4098:  
Check the Control Unit hardware.  
For alarm value = 4100:  
Reduce the frequency of the measuring pulses at the measuring probe.  
For alarm value > 50000:  
Set the clock cycle ratio of the measuring clock cycle to the position controller clock cycle to an integer multiple.  
To do this, the currently effective measuring clock cycle can be determined from the alarm value as follows:  
 $T_{meas} [125 \mu s] = \text{alarm value} - 50000$   
With PROFIBUS, the measuring clock cycle corresponds to the PROFIBUS clock cycle (r2064[1]).  
Without PROFIBUS, the measuring clock cycle is an internal cycle time that cannot be influenced.

<b>F07499 (A)</b>	<b>EPOS: Reversing cam approached with the incorrect traversing direction</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF3
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The reversing cam MINUS was approached in the positive traversing direction or the reversing cam PLUS was approached in the negative traversing direction. See also: p2613 (EPOS search for reference reversing cam minus), p2614 (EPOS search for reference reversing cam plus)
<b>Remedy:</b>	- check the wiring of the reversing cam (BI: p2613, BI: p2614). - check the traversing direction to approach the reversing cam.

---

<b>F07503</b>	<b>EPOS: STOP cam approached with the incorrect traversing direction</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The STOP cam MINUS was approached in the positive traversing direction or the STOP cam PLUS was approached in the negative traversing direction.
<b>Remedy:</b>	- check the wiring of the STOP cam (BI: p2569, BI: p2570). - check the traversing direction to approach the STOP cam.

---

<b>A07505</b>	<b>EPOS: Task fixed stop not possible in the U/f/SLVC mode</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	In the U/f/SLVC mode, an attempt was made to execute a traversing block with the "fixed stop" task. This is not possible. Alarm value (r2124, interpret decimal): Number of the traversing block with an illegal task parameter.
<b>Remedy:</b>	- check the traversing block and change the task. - change the open-loop/closed-loop control mode (p1300). See also: p1300 (Open-loop/closed-loop control operating mode), p2621 (EPOS traversing block task)

---

<b>F07509</b>	<b>Drive: Component assignment missing</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	An encoder (p0187, p0188) was selected, however no physical connection assigned (p0468).
<b>Remedy:</b>	For operation with encoder, set the encoder interface (p0468). Note: If operation without encoder is required, set the encoder assignment to "not used" (p0187 = 99 or p0188 = 99). See also: p0142 (Encoder component number), p0187 (Encoder 1 encoder data set number), p0188 (Encoder 2 encoder data set number)

---

<b>A07530</b>	<b>Drive: Drive Data Set DDS not present</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The selected drive data set is not available (p0837 > p0180). The drive data set was not changed over. See also: p0180 (Number of Drive Data Sets (DDS)), p0820 (Drive Data Set selection DDS bit 0), p0821 (Drive Data Set selection DDS bit 1), r0837 (Drive Data Set DDS selected)
<b>Remedy:</b>	- select the existing drive data set. - set up additional drive data sets.

---

<b>A07531</b>	<b>Drive: Command Data Set CDS not present</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The selected command data set is not available (p0836 > p0170). The command data set was not changed over. See also: p0810 (Command data set selection CDS bit 0), p0811 (Command data set selection CDS bit 1), r0836 (Command Data Set CDS selected)
<b>Remedy:</b>	- select the existing command data set. - set up additional command data sets.

---

<b>A07550 (F, N)</b>	<b>Drive: Not possible to reset encoder parameters</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	When carrying out a factory setting (e.g. using p0970 = 1), it was not possible to reset the encoder parameters. The encoder parameters are directly read out of the encoder via DRIVE-CLiQ. Alarm value (r2124, interpret decimal): Component number of the encoder involved.
<b>Remedy:</b>	- repeat the operation. - check the DRIVE-CLiQ connection.

---

<b>F07551</b>	<b>Drive encoder: No commutation angle information</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF2 (IASC/DCBRK)
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The commutation angle information is missing. This means that synchronous motors cannot be controlled (closed-loop control) Fault value (r0949, interpret decimal): yyyyxxxx dec: yyyy = fault cause, xxxx = drive data set yyyy = 1 dec: The motor encoder used does not supply an absolute commutation angle. yyyy = 2 dec: The selected ratio of the measuring gear does not match the motor pole pair number.
<b>Remedy:</b>	For fault cause = 1: - check the encoder parameterization (p0404). - use an encoder with track C/D, EnDat interface of Hall sensors. - use an encoder with sinusoidal A/B track for which the motor pole pair number (r0313) is an integer multiple of the encoder pulse number (p0408). - activate the pole position identification routine (p1982 = 1) for motor encoders without absolute position information. Then, using an encoder adjustment (p1990), the angular commutation offset should be determined.

For fault cause = 2:

- the quotient of the pole pair number divided by the ratio of the measuring gear must be an integer number:  $(p0314 * p0433) / p0432$ .

Note:

For operation with track C/D, this quotient must be less than 8.

### **F07552 (A) Drive encoder: Encoder configuration not supported**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The requested encoder configuration is not supported. Only bits may be requested in p0404 that are signaled as being supported by the encoder evaluation in r0456.

Fault value (r0949, interpret decimal):

ccccbbaa hex: cccc = fault cause, bb = component number, aa = encoder data set

cccc = 1: encoder sin/cos with absolute track (is supported by SME25).

cccc = 3: Squarewave encoder (this is supported by SMC30).

cccc = 4: sin/cos encoder (this is supported by SMC20, SMI20, SME20, SME25).

cccc = 10: DRIVE-CLiQ encoder (is supported by DQI).

cccc = 12: sin/cos encoder with reference mark (this is supported by SME20).

cccc = 15: Commutation with zero mark for separately-excited synchronous motors with VECTORMV.

cccc = 23: Resolver (this is supported by SMC10, SMI10).

cccc = 65535: Other function (compare r0456 and p0404).

See also: p0404 (Encoder configuration effective), r0456 (Encoder configuration supported)

**Remedy:** - check the encoder parameterization (p0400, p0404).

- use the matching encoder evaluation (r0456).

---

### **F07553 (A) Drive encoder: Sensor Module configuration not supported**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The Sensor Module does not support the requested configuration.

For incorrect p0430 (cc = 0), the following applies:

- in p0430 (requested functions), at least 1 bit was set that is not set in r0458 (supported functions) (exception: Bit 19, 28, 29, 30, 31).

- p1982 > 0 (pole position identification requested), but r0458.16 = 0 (pole position identification not supported).

For incorrect p0437 (cc = 1), the following applies:

- in p0437 (requested functions), at least 1 bit was set that is not set in r0459 (supported functions).

Fault value (r0949, interpret hexadecimal):

ddccbbaa hex

aa: encoder data set number

bb: first incorrect bit

cc: incorrect parameter

cc = 0: incorrect parameter is p0430

cc = 1: incorrect parameter is p0437

cc = 2: incorrect parameter is r0459

dd: reserved (always 0)

**Remedy:** - check the encoder parameterization (p0430, p0437).

- check the pole position identification routine (p1982).

- use the matching encoder evaluation (r0458, r0459).

<b>F07555 (A)</b>	<b>Drive encoder: Configuration position tracking</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	For position tracking, the configuration is not supported. Position tracking can only be activated for absolute encoders. For linear axes, it is not possible to simultaneously activate the position tracking for load and measuring gears. Fault value (r0949, interpret hexadecimal): ddccbbaa hex aa = encoder data set bb = component number cc = drive data set dd = fault cause dd = 00 hex = 0 dec An absolute encoder is not being used. dd = 01 hex = 1 dec Position tracking cannot be activated because the memory of the internal NVRAM is not sufficient or a Control Unit does not have an NVRAM. dd = 02 hex = 2 dec For a linear axis, the position tracking was activated for the load and measuring gear. dd = 03 hex = 3 dec Position tracking cannot be activated because position tracking with another gear ratio, axis type or tolerance window has already been detected for this encoder data set. dd = 04 hex = 4 dec A linear encoder is being used. See also: p0404 (Encoder configuration effective), p0411 (Measuring gear configuration)
<b>Remedy:</b>	For fault value 0: - use an absolute encoder. For fault value 1: - use a Control Unit with sufficient NVRAM. For fault value = 2, 4: - if necessary, de-select the position tracking (p0411 for the measuring gear, p2720 for the load gear). For fault value 3: - Only activate position tracking of the load gear in the same encoder data set if the gear ratio (p2504, p2505), axis type (p2720.1) and tolerance window (p2722) are also the same. These parameters must be the same in all drive data sets, which use the same motor encoder (p187).

<b>Reaction:</b>	OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The requested position tracking for incremental encoders is not supported. Fault value (r0949, interpret hexadecimal): ccccbbaa hex aa = encoder data set bb = component number cccc = fault cause cccc = 00 hex = 0 dec The encoder type does not support the "Position tracking incremental encoder" function. cccc = 01 hex = 1 dec Position tracking cannot be activated because the memory of the internal NVRAM is not sufficient or a Control Unit does not have an NVRAM.

## 4 Faults and alarms

### 4.2 List of faults and alarms

cccc = 04 hex = 4 dec

A linear encoder is used that does not support the "position tracking" function.

See also: p0404 (Encoder configuration effective), p0411 (Measuring gear configuration), r0456 (Encoder configuration supported)

**Remedy:**

- check the encoder parameterization (p0400, p0404).
- use a Control Unit with sufficient NVRAM.
- if required, de-select position tracking for the incremental encoder (p0411.3 = 0).

#### **F07563 (A) Drive encoder: XIST1\_ERW configuration incorrect**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** An incorrect configuration was identified for the "Absolute position for incremental encoder" function.

Fault value (r0949, interpret decimal):

Fault cause:

1 (= 01 hex):

The "Absolute value for incremental encoder" function is not supported (r0459.13 = 0).

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

yyxx dec: yy = fault cause, xx = encoder data set

See also: r0459 (Sensor Module properties extended), p4652 (XIST1\_ERW reset mode)

#### **A07569 (F) Enc identification active**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** During encoder identification (waiting) with p0400 = 10100, the encoder could still not be identified.

Either the wrong encoder has been installed or no encoder has been installed, the wrong encoder cable has been connected or no encoder cable has been connected to the Sensor Module, or the DRIVE-CLiQ component has not been connected.

## Note:

Encoder identification must be supported by the encoder and is possible in the following cases:

- Encoder with EnDat interface.
- Encoder with SSI interface.
- Motor with DRIVE-CLiQ.

**Remedy:**

- check and, if necessary, connect the encoder / encoder cable.
- check and, if necessary, establish the DRIVE-CLiQ connection.
- for SSI encoders, carry out the required operator actions (see the Function Manual).
- in the case of encoders that cannot be identified (e.g. encoders without EnDat interface), enter the correct encoder type in p0400.

6: The input terminal for the measuring probe is not set.

4098: Error when initializing the measuring probe.

4100: The measuring pulse frequency is too high.

4200: The PROFIBUS clock cycle is not a multiple of integer of the position controller clock cycle.

**Remedy:**

De-activate the measuring probe evaluation (BI: p2509 = 0 signal).

For alarm value = 6:

Set the input terminal for the measuring probe (p0488, p0489 or p2517, p2518).

For alarm value = 4098:

Check the Control Unit hardware.

For alarm value = 4100:

Reduce the frequency of the measuring pulses at the measuring probe.

**F07801 Drive: Motor overcurrent**

**Message class:** Motor overload (8)

**Reaction:** OFF2 (NONE, OFF1, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** The permissible motor limit current was exceeded.

- effective current limit set too low.
- current controller not correctly set.
- U/f operation: Up ramp was set too short or the load is too high.
- U/f operation: Short-circuit in the motor cable or ground fault.
- U/f operation: Motor current does not match current of power unit.
- Switch to rotating motor without flying restart function (p1200).

Note:

Limit current = 2 x minimum (p0640, 4 x p0305 x p0306) >= 2 x p0305 x p0306

**Remedy:**

- check the current limits (p0640).
- vector control: Check the current controller (p1715, p1717).
- U/f control: Check the current limiting controller (p1340 ... p1346).
- increase the up ramp (p1120) or reduce the load.
- check the motor and motor cables for short-circuit and ground fault.
- check the motor for the star-delta configuration and rating plate parameterization.
- check the power unit and motor combination.
- Choose "flying restart" function (p1200) if switched to rotating motor.

**Message class:** Infeed faulted (13)

**Reaction:** OFF2 (NONE)

**Acknowledge:** IMMEDIATELY

**Cause:** After an internal switch-on command, the infeed or drive does not signal ready.

- monitoring time is too short.
- DC link voltage is not present.
- associated infeed or drive of the signaling component is defective.
- supply voltage incorrectly set.

**Remedy:**

- increase the monitoring time (p0857).
  - ensure that there is a DC link voltage. Check the DC link busbar. Enable the infeed.
  - replace the associated infeed or drive of the signaling component.
  - check the line supply voltage setting (p0210).

**Message class:** Power electronics faulted (5)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Alarm threshold for I2t overload (p0294) of the power unit exceeded.

The response parameterized in p0290 becomes active.

See also: p0290 (Power unit overload response)

**Remedy:**

- reduce the continuous load.
- adapt the load duty cycle.
- check the assignment of the motor and power unit rated currents.

---

**F07806 Drive: Regenerative power limit exceeded (F3E)**

**Message class:** Power electronics faulted (5)

**Reaction:** OFF2 (IASC/DCBRK)

**Acknowledge:** IMMEDIATELY

**Cause:** For blocksize power units, types PM250 and PM260, the regenerative rated power r0206[2] was exceeded for more than 10 s.

See also: r0206 (Rated power unit power), p1531 (Power limit regenerative)

- Remedy:**
- increase the down ramp.
  - reduce the driving load.
  - use a power unit with a higher regenerative feedback capability.
  - for vector control, the regenerative power limit in p1531 can be reduced so that the fault is no longer triggered.

**F07807 Drive: Short-circuit/ground fault detected**

**Message class:** Ground fault / inter-phase short-circuit detected (7)

**Reaction:** OFF2 (NONE)

**Acknowledge:** IMMEDIATELY

**Cause:** A phase-phase short-circuit or ground fault was detected at the motor-side output terminals of the converter.

Fault value (r0949, interpret decimal):

1: Short-circuit, phase UV.

2: Short-circuit, phase UW.

3: Short-circuit, phase VW.

4: Ground fault with overcurrent.

1yxxx: Ground fault with current in phase U detected (y = pulse number, xxxx = component of the current in phase U in per mille).

2yxxx: Ground fault with current in phase V detected (y = pulse number, xxxx = component of the current in phase U in per mille).

Note:

Also when interchanging the line and motor cables is identified as a motor-side short circuit.

The ground fault test only functions when the motor is stationary.

Connecting to a motor that is either not de-energized or partially de-energized is possibly detected as ground fault.

**Remedy:**

- check the motor-side converter connection for a phase-phase short-circuit.

- rule-out interchanged line and motor cables.

- check for a ground fault.

For a ground fault the following applies:

- do not enable the pulses when connecting to a rotating motor without the "Flying restart" function activated (p1200).

- increase the de-energization time (p0347).

- increase pulse suppression delay time (p1228) to ensure standstill.

- if required, de-activate the monitoring (p1901).

**A07891 Drive: Load monitoring pump/fan blocked**

**Message class:** Motor overload (8)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The load monitoring is configured for a pump or fan (p2193 = 4, 5).  
The monitoring function detects when the pump/fan is blocked.  
It is possible that the blocking torque threshold (p2168) is set too low (e.g. heavy duty starting).  
See also: p2181 (Load monitoring response), p2193 (Load monitoring configuration)  
**Remedy:**  
- check whether the pump/fan is blocked, and if blocked, then resolve the problem.  
- check that the fan can freely move, and if necessary, resolve the problem.  
- adapt the parameterization corresponding to the load (p2165, p2168)..

---

**A07892 Drive: Load monitoring pump/fan no load condition**

**Message class:** Application/technological function faulted (17)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The load monitoring is configured for a pump or fan (p2193 = 4, 5).  
The monitoring function detects when the pump/fan is operating under no load conditions.  
The pump is running in the dry state (no medium to be pumped) – or the fan has a broken belt.  
It is possible that the detection torque threshold is too low (p2191).  
See also: p2181 (Load monitoring response), p2193 (Load monitoring configuration)  
**Remedy:**  
- for a pump, check the medium being pumped, and if required, provide the medium.  
- for a fan, check the belt, and if required, replace.  
- if necessary, increase the detection torque threshold (p2191).

---

**A07893 Drive: Load monitoring pump leakage**

**Message class:** Application/technological function faulted (17)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The load monitoring is configured for a pump (p2193 = 4).  
The monitoring function detects a leak in the pump circuit.  
In this case, the pump requires a torque that is lower than in normal operation to pump the reduced quantity.  
See also: p2181, p2182, p2183, p2184, p2186, p2188, p2190, p2193  
**Remedy:**  
- remove the leak in the pump circuit.  
- for a nuisance trip, reduce the torque thresholds of the leakage characteristic (p2186, p2188, p2190).

---

**F07894 Drive: Load monitoring pump/fan blocked**

**Message class:** Motor overload (8)  
**Reaction:** OFF1 (NONE, OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** The load monitoring is configured for a pump or fan (p2193 = 4, 5).  
The monitoring function detects when the pump/fan is blocked.  
It is possible that the blocking torque threshold (p2168) is set too low (e.g. heavy duty starting).  
See also: p2181 (Load monitoring response), p2193 (Load monitoring configuration)  
**Remedy:**  
- check whether the pump/fan is blocked, and if blocked, then resolve the problem.  
- check that the fan can freely move, and if necessary, resolve the problem.  
- adapt the parameterization corresponding to the load (p2165, p2168)..

<b>F07895</b>	<b>Drive: Load monitoring pump/fan no load condition</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The load monitoring is configured for a pump or fan (p2193 = 4, 5). The monitoring function detects when the pump/fan is operating under no load conditions. The pump is running in the dry state (no medium to be pumped) – or the fan has a broken belt. It is possible that the detection torque threshold is too low (p2191). See also: p2181 (Load monitoring response), p2193 (Load monitoring configuration)
<b>Remedy:</b>	- for a pump, check the medium being pumped, and if required, provide the medium. - for a fan, check the belt, and if required, replace. - if necessary, increase the detection torque threshold (p2191).
<hr/>	
<b>F07896</b>	<b>Drive: Load monitoring pump leakage</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The load monitoring is configured for a pump (p2193 = 4). The monitoring function detects a leak in the pump circuit. In this case, the pump requires a torque that is lower than in normal operation to pump the reduced quantity. See also: p2181, p2182, p2183, p2184, p2186, p2188, p2190, p2193
<b>Remedy:</b>	- remove the leak in the pump circuit. - for a nuisance trip, reduce the torque thresholds of the leakage characteristic (p2186, p2188, p2190).
<hr/>	
<b>F07900 (N, A)</b>	<b>Drive: Motor blocked</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF2 (NONE, OFF1, OFF3, STOP2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	Motor has been operating at the torque limit longer than the time specified in p2177 and below the speed threshold set in p2175. This signal can also be triggered if the speed is oscillating and the speed controller output repeatedly goes to its limit. It may also be the case that thermal monitoring of the power unit reduces the current limit (see p0290), thereby causing the motor to decelerate. See also: p2175 (Motor blocked speed threshold), p2177 (Motor blocked delay time)
<b>Remedy:</b>	- check that the motor can freely move. - check the effective torque limit (r1538, r1539). - check the parameter, message "Motor blocked" and if required, correct (p2175, p2177). - check the direction of rotation enable signals for a flying restart of the motor (p1110, p1111). - for U/f control: check the current limits and acceleration times (p0640, p1120).
<hr/>	
<b>F07901</b>	<b>Drive: Motor overspeed</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF2 (IASC/DCBRK)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The maximum permissible speed was either positively or negatively exceeded. The maximum permissible positive speed is formed as follows: Minimum (p1082, Cl: p1085) + p2162 The maximum permissible negative speed is formed as follows: Maximum (-p1082, Cl: 1088) - p2162
<b>Remedy:</b>	The following applies for a positive direction of rotation: - check r1084 and if required, correct p1082, Cl:p1085 and p2162. The following applies for a negative direction of rotation: - check r1087 and if required, correct p1082, Cl:p1088 and p2162. Activate pre-control of the speed limiting controller (p1401.7 = 1). Increase the hysteresis for the overspeed signal p2162. This upper limit is dependent upon the maximum motor speed p0322 and the maximum speed p1082 of the setpoint channel.

<b>F07902 (N, A)</b>	<b>Drive: Motor stalled</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	For a vector drive the system has identified that the motor has stall for a time longer than is set in p2178. Fault value (r0949, interpret decimal): 1: Stall detection using r1408.11 (p1744, p0492) vector control with encoder. 2: Stall detection using r1408.12 (p1745) or (r0084 ... r0083). See also: p1744 (Motor model speed threshold stall detection), p2178 (Motor stalled delay time)
<b>Remedy:</b>	Steps should always be taken to ensure that both motor data identification and the rotating measurement were carried out (see p1900, r3925). For closed-loop speed and torque control with speed encoder, the following applies: - check the speed signal (interrupted cable, polarity, pulse number, broken encoder shaft). - check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the same motor that is controlled for the data set changeover. If there is no fault, then the fault tolerance (p1744 and p0492) can be increased. For closed-loop speed and torque control without speed encoder, the following applies: - check whether the drive stalls solely due to the load in controlled mode or when the speed setpoint is still zero. If yes, then increase the current setpoint using p1610. - if the motor excitation time (p0346) was significantly reduced and the drive stalls when it is switched on and run immediately, p0346 should be increased again. If there is no fault, then the fault tolerance can be increased (p1745). - check the current limits (p0640, r0067, r0289). If the current limits are too low, then the drive cannot be magnetized. - if the fault occurs with fault value 2 when the motor accelerates very quickly to the field weakening range, the deviation between the flux setpoint and flux actual value can be reduced and, in turn, the message prevented, by reducing p1596 or p1553. The following generally apply for closed-loop and torque control: - check whether a line phase failure is affecting power unit PM250D. - check whether the motor cables are disconnected (see A07929). If there is no fault, then the delay time can be increased (p2178).
<b>A07903</b>	<b>Drive: Motor speed deviation</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The absolute value of the speed difference from the setpoint (p2151) and the speed actual value (r2169) exceeds the tolerance threshold (p2163) longer than tolerated (p2164, p2166). The alarm is only enabled for p2149.0 = 1. Possible causes: - the load torque is greater than the torque setpoint. - when accelerating, the torque/current/power limit is reached. If the limits are not sufficient, then it is possible that the drive has been dimensioned too small. - for closed-loop torque control, the speed setpoint does not track the speed actual value. - for active Vdc controller. For U/f control, the overload condition is detected as the I <sub>max</sub> controller is active. See also: p2149 (Monitoring configuration)
<b>Remedy:</b>	- increase p2163 and/or p2166. - increase the torque/current/power limits. - for closed-loop torque control: The speed setpoint should track the speed actual value. - de-activate alarm with p2149.0 = 0.

<b>A07910 (N)</b>	<b>Drive: Motor overtemperature</b>
<b>Message class:</b>	Motor overload (8)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	KTY84/PT1000 or no sensor: The measured motor temperature or the temperature of the motor temperature model 2 has exceeded the alarm threshold (p0604). The response parameterized in p0610 becomes active. PTC or bimetallic NC contact: The response threshold of 1650 Ohm was exceeded or the NC contact opened. Alarm value (r2124, interpret decimal): 11: No output current reduction. 12: Output current reduction active. See also: p0604 (Mot_temp_mod 2/sensor alarm threshold), p0610 (Motor overtemperature response)
<b>Remedy:</b>	- check the motor load. - check the motor ambient temperature. - check KTY84/PT1000. - check overtemperatures of the motor temperature model 2 (p0626 ... p0628). See also: p0612 (Mot_temp_mod activation), p0625 (Motor ambient temperature during commissioning), p0626 (Motor overtemperature, stator core), p0627 (Motor overtemperature, stator winding), p0628 (Motor overtemperature rotor)

<b>A07920</b>	<b>Drive: Torque/speed too low</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	For p2193 = 1: The torque deviates from the torque/speed envelope characteristic (too low). For p2193 = 2: The speed signal from the external encoder (refer to p3230) deviates from the speed (r2169) (too low). See also: p2181 (Load monitoring response)
<b>Remedy:</b>	- check the connection between the motor and load. - adapt the parameterization corresponding to the load.

---

<b>A07921</b>	<b>Drive: Torque/speed too high</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	For p2193 = 1: The torque deviates from the torque/speed envelope characteristic (too high). For p2193 = 2: The speed signal from the external encoder (refer to p3230) deviates from the speed (r2169) (too high).
<b>Remedy:</b>	- check the connection between the motor and load. - adapt the parameterization corresponding to the load.

---

<b>A07922</b>	<b>Drive: Torque/speed out of tolerance</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	For p2193 = 1: The torque deviates from the torque/speed envelope characteristic. For p2193 = 2: The speed signal from the external encoder (refer to p3230) deviates from the speed (r2169).
<b>Remedy:</b>	- check the connection between the motor and load. - adapt the parameterization corresponding to the load.

---

<b>F07923</b>	<b>Drive: Torque/speed too low</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	For p2193 = 1: The torque deviates from the torque/speed envelope characteristic (too low). For p2193 = 2: The speed signal from the external encoder (refer to p3230) deviates from the speed (r2169) (too low).
<b>Remedy:</b>	- check the connection between the motor and load. - adapt the parameterization corresponding to the load.

---

<b>F07924</b>	<b>Drive: Torque/speed too high</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	For p2193 = 1: The torque deviates from the torque/speed envelope characteristic (too high). For p2193 = 2: The speed signal from the external encoder (refer to p3230) deviates from the speed (r2169) (too high).
<b>Remedy:</b>	- check the connection between the motor and load. - adapt the parameterization corresponding to the load.

---

<b>F07925</b>	<b>Drive: Torque/speed out of tolerance</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	For p2193 = 1: The torque deviates from the torque/speed envelope characteristic. For p2193 = 2: The speed signal from the external encoder (refer to p3230) deviates from the speed (r2169).
<b>Remedy:</b>	- check the connection between the motor and load. - adapt the parameterization corresponding to the load.

---

<b>A07926</b>	<b>Drive: Envelope curve parameter invalid</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	Invalid parameter values were entered for the envelope characteristic of the load monitoring. The following rules apply for the speed thresholds: p2182 < p2183 < p2184 The following rules apply for the torque thresholds: p2185 > p2186 p2187 > p2188 p2189 > p2190 Load monitoring configuration and response must match. It is not permissible that the individual load torque monitoring areas overlap. Alarm value (r2124, interpret decimal): Number of the parameter with the invalid value. The load torque monitoring has not been activated as long as the alarm is active.
<b>Remedy:</b>	- set the parameters for the load monitoring according to the applicable rules. - if necessary, de-activate the load monitoring (p2181 = 0, p2193 = 0).

---

<b>A07927</b>	<b>DC braking active</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The motor is braked with DC current. DC braking is active. 1) A message with response DCBRK is active. The motor is braked with the braking current set in p1232 for the duration set in in p1233. If the standstill threshold p1226 is undershot, then braking is prematurely canceled. 2) DC braking has been activated at binector input p1230 with the DC braking set (p1230 = 4). Braking current p1232 is injected until this binector input becomes inactive.
<b>Remedy:</b>	Not necessary. The alarm automatically disappears once DC braking has been executed.

---

<b>A07929 (F)</b>	<b>Drive: No motor detected</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The absolute current value is so small after enabling the inverter pulses that no motor is detected. Note: - for vector control and induction motor, fault F07902 follows this alarm. See also: p2179 (Output load identification current limit)
<b>Remedy:</b>	- check the motor feeder cables. - reduce the threshold value (p2179), e.g. for synchronous motors. - check the voltage boost of the U/f control (p1310). - carry out a standstill measurement to set the stator resistance (p0350).

---

<b>F07930</b>	<b>Drive: Brake control error</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The Control Unit has detected a brake control error. - motor cable is not correctly connected. - motor cable is not shielded correctly. - defect in the Safe Brake Module, in the Power Module or in the Control Unit. Fault value (r0949, interpret decimal): 10, 11: Fault in "open holding brake" operation. - no brake connected or wire breakage (check whether brake releases for p1278 = 1). - ground fault in brake cable. 20: Fault in "brake open" state. - short-circuit in brake winding. 30, 31: Fault in "close holding brake" operation. - no brake connected or wire breakage (check whether brake releases for p1278 = 1). - short-circuit in brake winding. 40: Fault in "brake closed" state. 50: Fault in the brake control circuit of the Control Unit or communication error between processor 1 and processor 2 (brake control diagnostics). See also: p1278 (Brake control diagnostics evaluation)

**Remedy:**

- check the motor holding brake connection.
- check the function of the motor holding brake.
- check the Safe Brake Module connection.
- check that the electrical cabinet design and cable routing are in compliance with EMC regulations (e.g. shield of the motor cable and brake conductors are connected with the shield connecting plate and the motor connectors are tightly screwed to the housing).
- replace the Safe Brake Module.
- replace Power Module.
- replace the Control Unit.

**F07935 (N) Drive: Incorrect motor holding brake configuration**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE (OFF1, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** An incorrect motor holding brake configuration was detected.

Fault value (r0949, interpret decimal):

0:

A motor holding brake was detected where the brake control has not been configured (p1215 = 0).

The brake control configuration was set to "motor holding brake the same as sequence control" (p1215 = 1) (only when commissioning for the first time).

1:

A motor holding brake was detected where the brake control has not been configured (p1215 = 0).

The brake control configuration was left at "No motor holding brake available" (p1215 = 0).

**Remedy:**

For fault value = 0:

- no remedy required.

For fault value = 1:

- if required change the motor holding brake configuration (p1215 = 1, 2).

- if this fault value unexpectedly occurs, then the motor connections should be checked in order to rule out that they have been interchanged with other drive units.

See also: p1215 (Motor holding brake configuration)

---

**F07936 Drive: load failure**

**Message class:** Application/technological function faulted (17)

**Reaction:** OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** The load monitoring has detected a load failure.

**Remedy:**

- check the sensor.

- if necessary, de-activate the load monitoring (p2193).

See also: p2193 (Load monitoring configuration), p3232 (Load monitoring failure detection)

---

**F07950 (A) Motor parameter incorrect**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** The motor parameters were incorrectly entered while commissioning (e.g. p0300 = 0, no motor)

Fault value (r0949, interpret decimal):

Parameter number involved.

**Remedy:**

Compare the motor data with the rating plate data and if required, correct.

<b>A07960</b>	<b>Drive: Incorrect friction characteristic</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The friction characteristic is incorrect. Alarm value (r2124, interpret decimal): 1538: The friction torque is greater than the maximum from the upper effective torque limit (p1538) and zero. This is the reason that the output of the friction characteristic (r3841) is limited to this value. 1539: The friction torque is less than the minimum from the lower effective torque limit (p1539) and zero. This is the reason that the output of the friction characteristic (r3841) is limited to this value. 3820 ... 3829: Incorrect parameter number. The speeds entered in the parameters for the friction characteristic do not correspond to the following condition: $0.0 < p3820 < p3821 < \dots < p3829 \leq p0322$ or $p1082$ , if $p0322 = 0$ Therefore the output of the friction characteristic (r3841) is set to zero. 3830 ... 3839: Incorrect parameter number. The torques entered in the parameters for the friction characteristic do not correspond to the following condition: $0 \leq p3830, p3831 \dots p3839 \leq p0333$ Therefore the output of the friction characteristic (r3841) is set to zero. See also: r3840 (Friction characteristic status word)
<b>Remedy:</b>	Fulfill the conditions for the friction characteristic. For alarm value = 1538: Check the upper effective torque limit (e.g. in the field weakening range). For alarm value = 1539: Check the lower effective torque limit (e.g. in the field weakening range). For alarm value = 3820 ... 3839: Fulfill the conditions to set the parameters of the friction characteristic. If the motor data (e.g. the maximum speed p0322) are changed during commissioning ( $p0010 = 1, 3$ ), then the technological limits and threshold values, dependent on this, must be re-calculated by selecting $p0340 = 5$ .

<b>A07961</b>	<b>Drive: Friction characteristic record activated</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The automatic friction characteristic record is activated. The friction characteristic is recorded at the next switch-on command. When plotting the friction characteristic, it is not possible to save the parameters (p0971, p0977).
<b>Remedy:</b>	Not necessary. The alarm disappears automatically after the friction characteristic record has been successfully completed or the record is de-activated ( $p3845 = 0$ ).

<b>F07963</b>	<b>Drive: Friction characteristic record interrupted</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF1
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The conditions to record the friction characteristic are not fulfilled. Fault value (r0949, interpret decimal): 0046: Missing enable signals (r0046). 1082: The highest speed value to be approached (p3829) is greater than the maximum speed (p1082). 1084: The highest speed value to be approached (p3829) is greater than the maximum speed (r1084, p1083, p1085). 1087: The highest speed value to be approached (p3829) is greater than the maximum speed (r1087, p1086, p1088). 1110: Friction characteristic record, negative direction selected (p3845) and negative direction inhibited (p1110). 1111: Friction characteristic record, positive direction selected (p3845) and positive direction inhibited (p1111).

1198: Friction characteristic record selected (p3845 > 0) and negative (p1110) and positive directions (p1111) inhibited (r1198).  
1300: The control mode (p1300) has not been set to closed-loop speed control.  
1755: For encoderless closed-loop control (p1300 = 20), the lowest speed value to be approached (p3820) is less than or equal to the changeover speed, open-loop controlled operation (p1755).  
1910: Motor data identification activated.  
1960: Speed controller optimization activated.  
3820 ... 3829: speed (p382x) cannot be approached.  
3840: Friction characteristic incorrect.  
3845: Friction characteristic record de-selected.

**Remedy:** Fulfill the conditions to record the friction characteristic.

For fault value = 0046:  
- establish missing enable signals.

For fault value = 1082, 1084, 1087:  
- Select the highest speed value to be approached (p3829) less than or equal to the maximum speed (p1082, r1084, r1087).  
- Re-calculate the speed points along the friction characteristic (p0340 = 5).

For fault value = 1110:  
- Select the friction characteristic record, positive direction (p3845).

For fault value = 1111:  
- Select the friction characteristic record, negative direction (p3845).

For fault value = 1198:  
- Enable the permitted direction (p1110, p1111, r1198).

For fault value = 1300:  
- set the control mode (p1300) on the closed-loop speed control (p1300 = 20, 21).

For fault value = 1755:  
- For encoderless closed-loop speed control (p1300 = 20) select the lowest speed value to be approached (p3820) greater than the changeover speed of open-loop controlled operation (p1755).  
- Re-calculate the speed points along the friction characteristic (p0340 = 5).

For fault value = 1910:  
- Exit the motor data identification routine (p1910).

For fault value = 1960:  
- Exit the speed controller optimization routine (p1960).

For fault value 3820 ... 3829:  
- check the load at speed p382x.  
- check the speed signal (r0063) for oscillation at speed p382x. Check the settings of the speed controller if applicable.

For fault value = 3840:  
- Make the friction characteristic error-free (p3820 ... p3829, p3830 ... p3839, p3840).

For fault value = 3845:  
- Activate the friction characteristic record (p3845).

<b>Remedy:</b>	For fault value = 1: - the total drive moment of inertia is far higher than that of the motor (p0341, p0342). De-select rotating measurement (p1960), enter the moment of inertia p0342, re-calculate the speed controller p0340 = 4 and repeat the measurement. For fault value = 1 ... 2: - increase the measuring speed (p1961) and repeat the measurement. For fault value = 1 ... 4: - check the motor parameters (rating plate data). ## 4 Faults and alarms

### 4.2 List of faults and alarms

- 7: It is not possible to increase the speed by 10% as the maximum limiting is active.  
8: The torque difference after the speed setpoint step is too low in order to be able to still reliably identify the moment of inertia.  
9: Too few data to be able to reliably identify the moment of inertia.  
10: After the setpoint step, the speed either changed too little or in the incorrect direction.  
11: The identified moment of inertia is not plausible. The measured moment of inertia is less than the 0.1x or greater than 500x the preset moment of inertia of the motor p0341.

#### Remedy:

For fault value = 1:

- check the motor parameters (rating plate data). After the change: Calculate p0340 = 3.
- check the moment of inertia (p0341, p0342). After the change: Calculate p0340 = 3.
- carry out a motor data identification routine (p1910).
- if required, reduce the dynamic factor (p1967 < 25 %).

For fault value = 2, 5:

- adapt the speed setpoint (p1965) or adapt the minimum limit (p1080).

For fault value = 3, 6:

- adapt the speed setpoint (p1965) or suppression (skip) bandwidths (p1091 ... p1094, p1101).

For fault value = 4, 7:

- adapt the speed setpoint (p1965) or maximum limit (p1082, p1083 and p1086).

For fault value = 8:

- the total drive moment of inertia is far higher than that of the motor (refer to p0341, p0342). De-select rotating measurement (p1960), enter the moment of inertia p0342, re-calculate the speed controller p0340 = 4 and repeat the measurement.

For fault value = 9:

- check the moment of inertia (p0341, p0342). After the change, re-calculate (p0340 = 3 or 4).

For fault value = 10:

- check the moment of inertia (p0341, p0342). After the change: Calculate p0340 = 3.

For fault value = 11:

- reduce the moment of inertia of the motor p0341 (e.g., factor of 0.2) or increase (e.g. factor of 5) and repeat the measurement.

Note:

The moment of inertia identification routine can be disabled using p1959.2.

**Message class:**

Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:**

OFF1 (NONE, OFF2)

**Acknowledge:**

IMMEDIATELY

**Cause:**

A fault has occurred during the vibration test.

Fault value (r0949, interpret decimal):

- 1: The speed did not reach a steady-state condition.
- 2: The speed setpoint was not able to be approached as the minimum limiting is active.
- 3: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active.
- 4: The speed setpoint was not able to be approached as the maximum limiting is active.
- 5: Torque limits too low for a torque step.
- 6: No suitable speed controller setting was found.

**Remedy:**

For fault value = 1:

- check the motor parameters (rating plate data). After the change: Calculate p0340 = 3.
- check the moment of inertia (p0341, p0342). After the change: Calculate p0340 = 3.
- carry out a motor data identification routine (p1910).
- if required, reduce the dynamic factor (p1967 < 25 %).

For fault value = 2:

- adapt the speed setpoint (p1965) or adapt the minimum limit (p1080).

For fault value = 3:

- adapt the speed setpoint (p1965) or suppression (skip) bandwidths (p1091 ... p1094, p1101).

For fault value = 4:

- adapt the speed setpoint (p1965) or maximum limit (p1082, p1083 and p1086).

For fault value = 5:  
- increase the torque limits (e.g. p1520, p1521).  
For fault value = 6:  
- reduce the dynamic factor (p1967).  
- disable the vibration test (p1959.4 = 0) and repeat the rotating measurement.

8: Identified stator leakage reactance lies outside the expected range 2 ... 50% of Zn.  
9: Identified rotor leakage reactance lies outside the expected range 2 ... 50% of Zn.  
10: Motor has been incorrectly connected.  
11: Motor shaft rotates.  
12: Ground fault detected.  
15: Pulse inhibit occurred during motor data identification.  
20: Identified threshold voltage of the semiconductor devices lies outside the expected range 0 ... 10 V.  
30: Current controller in voltage limiting.  
40: At least one identification contains errors. The identified parameters are not saved to prevent inconsistencies.  
**Note:**  
Percentage values are referred to the rated motor impedance:  
 $Z_n = V_{mot,nom} / \sqrt{3} / I_{mot,nom}$   
**Remedy:** For fault value = 1 ... 40:  
- check whether motor data have been correctly entered in p0300, p0304 ... p0311.  
- is there an appropriate relationship between the motor power rating and that of the power unit? The ratio of the power unit to the rated motor current should not be less than 0.5 and not be greater than 4.  
- check connection type (star-delta).

<b>A07994 (F, N)</b>	<b>Drive: motor data identification not performed</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The "vector control" mode has been selected and a motor data identification has still not been performed. The alarm is initiated when changing the drive data set (see r0051) in the following cases: - vector control is parameterized in the actual drive data set (p1300 >= 20). and - motor data identification has still not been performed in the actual drive data set (see r3925). Note: For SINAMICS G120, a check is made and an alarm is output also when exiting commissioning and when the system powers up.
<b>Remedy:</b>	- Perform motor data identification (see p1900). - if required, parameterize "U/f control" (p1300 < 20). - switch over to a drive data set, in which the conditions do not apply.

**Cause:** A syntax error has been detected in the ASCII configuration file for the Communication Board Ethernet. The saved configuration file has not been loaded.

**Remedy:** - correct the PROFINET interface configuration (p8920 and following) and activate (p8925 = 2).  
- reinitialize the station (e.g. using the STARTER commissioning software)

Note:

The configuration is not applied until the next POWER ON!

---

**A08565 PROFINET: Consistency error affecting adjustable parameters**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A consistency error was detected when activating the configuration (p8925) for the PROFINET interface. The currently set configuration has not been activated.

Alarm value (r2124, interpret decimal):

0: general consistency error

1: error in the IP configuration (IP address, subnet mask or standard gateway)

2: Error in the station names.

3: DHCP was not able to be activated, as a cyclic PROFINET connection already exists.

4: a cyclic PROFINET connection is not possible as DHCP is activated.

See also: p8920 (PN Name of Station), p8921 (PN IP address), p8922 (PN Def Gateway), p8923 (PN Subnet Mask)

**Remedy:** - check the required interface configuration (p8920 and following), correct if necessary, and activate (p8925).  
or

- Reconfigure the station via the "Edit Ethernet node" screen form (e.g. with STARTER commissioning software).

**F08700 (A) CAN: Communications error**

**Message class:** Communication error to the higher-level control system (9)

**Reaction:** OFF3 (NONE, OFF1, OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** A CAN communications error has occurred.

Fault value (r0949, interpret decimal):

1: The error counter for the send telegrams has exceeded the BUS OFF value 255. The bus disables the CAN controller.

- bus cable short circuit.

- incorrect baud rate.

- incorrect bit timing.

2: The master no longer interrogated the CAN node status longer than for its "life time". The "life time" is obtained from the "guard time" (p8604[0]) multiplied by the "life time factor" (p8604[1]).

- bus cable interrupted.

- bus cable not connected.

- incorrect baud rate.

- incorrect bit timing.

- master fault.

Note:

The fault response can be set as required using p8641.

See also: p8604 (CAN life guarding), p8641 (CAN Abort Connection Option Code)

---

**Remedy:**

- check the bus cable
- check the baud rate (p8622).
- check the bit timing (p8623).
- check the master.

The CAN controller must be manually restarted with p8608 = 1 after the cause of the fault has been resolved!

---

**F08701**      **CAN: NMT state change**

**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** OFF3  
**Acknowledge:** IMMEDIATELY  
**Cause:** A CANopen NMT state transition from "operational" to "pre-operational" or after "stopped".  
Fault value (r0949, interpret decimal):  
1: CANopen NMT state transition from "operational" to "pre-operational".  
2: CANopen NMT state transition from "operational" to "stopped".  
Note:  
In the NMT state "pre-operational", process data cannot be transferred and in the NMT state "stopped", no process data and no service data can be transferred.

**Remedy:** Not necessary.  
Acknowledge the fault and continue operation.

---

**F08702 (A)**      **CAN: RPDO Timeout**

**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** OFF3 (NONE, OFF1, OFF2)  
**Acknowledge:** IMMEDIATELY  
**Cause:** The monitoring time of the CANopen RPDO telegram has expired because the bus connection was either interrupted or the CANopen Master was switched-off.  
See also: p8699 (CAN: RPDO monitoring time)

**Remedy:**

- check the bus cable
- check the master.
- if required, increase the monitoring time (p8699).

---

**A08751 (N)**      **CAN: Telegram loss**

**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The CAN controller has lost a receive message (telegram).  
**Remedy:** Reduce the cycle times of the receive messages.

---

**A08752**      **CAN: Error counter for error passive exceeded**

**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The error counter for the send or receive telegrams has exceeded the value 127.

**Remedy:**

- check the bus cable
- set a higher baud rate (p8622).
- check the bit timing and if required optimize (p8623).

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

<b>A08753</b>	<b>CAN: Message buffer overflow</b>
<b>Message class:</b>	Communication error to the higher-level control system (9)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	A message buffer overflow. Alarm value (r2124, interpret decimal): 1: Non-cyclic send buffer (SDO response buffer) overflow. 2: Non-cyclic receive buffer (SDO receive buffer) overflow. 3: Cyclic send buffer (PDO send buffer) overflow.
<b>Remedy:</b>	- check the bus cable. - set a higher baud rate (p8622). - check the bit timing and if required optimize (p8623). For alarm value = 2: - reduce the cycle times of the SDO receive messages. - SDO request from master only after SDO feedback for previous SDO request. See also: p8622 (CAN bit rate), p8623 (CAN Bit Timing selection)
<hr/>	
<b>A08754</b>	<b>CAN: Incorrect communications mode</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	In the "operational" mode, an attempt was made to change parameters p8700 ... p8737.
<b>Remedy:</b>	Change to the "pre-operational" or "stopped" mode.
<hr/>	
<b>A08755</b>	<b>CAN: Obj cannot be mapped</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The CANopen object is not provided for the Process Data Object (PDO) Mapping.
<b>Remedy:</b>	Use a CANopen object intended for the PDO mapping or enter 0. The following objects can be mapped in the Receive Process Data Object (RPDO) or Transmit Process Data Object (TPDO): - RPDO: 6040 hex, 6060 hex, 60FF hex, 6071 hex; 5800 hex - 580F hex; 5820 hex - 5827 hex - TPDO: 6041 hex, 6061 hex, 6063 hex, 6069 hex, 606B hex, 606C hex, 6074 hex; 5810 hex - 581F hex; 5830 hex - 5837 hex Only sub-index 0 of the specified objects can be mapped. Note: As long as A08755 is present, the COB-ID cannot be set to valid.
<hr/>	
<b>A08756</b>	<b>CAN: Number of mapped bytes exceeded</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The number of bytes of the mapped objects exceeds the telegram size for net data. A max. of 8 bytes is permissible.
<b>Remedy:</b>	Map fewer objects or objects with a smaller data type. See also: p8710, p8711, p8712, p8713, p8714, p8715, p8716, p8717, p8730, p8731, p8732, p8733, p8734, p8735, p8736, p8737

---

<b>A08757</b>	<b>CAN: Set COB-ID invalid</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	For online operation, the appropriate COB-ID must be set invalid before mapping. Example: Mapping for RPDO 1 should be changed (p8710[0]). --> set p8700[0] = C00006E0 hex (invalid COB-ID) --> set p8710[0] as required. --> p8700[0] enter a valid COB-ID
<b>Remedy:</b>	Set the COB-ID to invalid.
<hr/>	
<b>A08759</b>	<b>CAN: PDO COB-ID already available</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	An existing PDO COB-ID was allocated.
<b>Remedy:</b>	Select another PDO COB-ID.
<hr/>	
<b>A08760</b>	<b>CAN: maximum size of the IF PZD exceeded</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The maximum size of the IF PZD was exceeded. Alarm value (r2124, interpret decimal): 1: error for IF PZD receive. 2: error for IF PZD send. Note: IF: interface
<b>Remedy:</b>	Map fewer process data in PDO. Apply one of the following options to delete the alarm: - POWER ON (switch-off/switch-on). - carry out a warm restart (p0009 = 30, p0976 = 2). - execute CANopen NMT command reset node. - change CANopen NMT state. - delete alarm buffer [0...7] (p2111 = 0).
<hr/>	
<b>A08800</b>	<b>PROFenergy energy-saving mode active</b>
<b>Message class:</b>	Communication error to the higher-level control system (9)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The PROFenergy energy-saving mode is active Alarm value (r2124, interpret decimal): Mode ID of the active PROFenergy energy-saving mode. See also: r5600 (Pe energy-saving mode ID)
<b>Remedy:</b>	The alarm is automatically withdrawn when the energy-saving mode is exited. Note: The energy-saving mode is exited after the following events: - the PROFenergy command end_pause is received from the higher-level control. - the higher-level control has changed into the STOP operating state. - the PROFINET connection to the higher-level control has been disconnected.

<b>A13000</b>	<b>License not adequate</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	<ul style="list-style-type: none"><li>- for the drive unit, the options that require a license are being used but the licenses are not sufficient.</li><li>- an error occurred when checking the existing licenses.</li></ul> Alarm value (r2124, interpret decimal): <ul style="list-style-type: none"><li>0: The existing license is not sufficient.</li><li>1: An adequate license was not able to be determined as the memory card with the required licensing data was withdrawn in operation.</li><li>2: An adequate license was not able to be determined as there is no licensing data available on the memory card.</li><li>3: An adequate license was not able to be determined as there is a checksum error in the license key.</li><li>4: An internal error occurred when checking the license.</li></ul>
<b>Remedy:</b>	<ul style="list-style-type: none"><li>For alarm value = 0: Additional licenses are required and these must be activated (p9920, p9921).</li><li>For alarm value = 1: With the system switched off, re-insert the memory card that matches the system.</li><li>For alarm value = 2: Enter and activate the license key (p9920, p9921).</li><li>For alarm value = 3: Compare the license key (p9920) entered with the license key on the certificate of license. Re-enter the license key and activate (p9920, p9921).</li><li>For alarm value = 4:<ul style="list-style-type: none"><li>- carry out a POWER ON.</li><li>- upgrade firmware to later version.</li><li>- contact Technical Support.</li></ul></li></ul>

---

<b>A13001</b>	<b>Error in license checksum</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	When checking the checksum of the license key, an error was detected.
<b>Remedy:</b>	Compare the license key (p9920) entered with the license key on the certificate of license. Re-enter the license key and activate (p9920, p9921).

---

<b>F13009</b>	<b>Licensing OA application not licensed</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF1
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	At least one OA application which is under license does not have a license. Note: Refer to r4955 and p4955 for information about the installed OA applications.
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- enter and activate the license key for OA applications under license (p9920, p9921).</li><li>- if necessary, de-activate unlicensed OA applications (p4956).</li></ul> See also: p9920 (Licensing enter license key), p9921 (Licensing activate license key)

---

<b>F13010</b>	<b>Licensing function module not licensed</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF1
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	At least one function module which is under license does not have a license. Fault value (r0949, interpret hexadecimal): Bit x = 1: The corresponding function module does not have a license. Note: Refer to p0108 or r0108 for the assignment between the bit number and function module.
<b>Remedy:</b>	- enter and activate the license key for function modules under license (p9920, p9921). - if necessary, de-activate unlicensed function modules (p0108, r0108). See also: p9920 (Licensing enter license key), p9921 (Licensing activate license key)
<hr/>	
<b>F13100</b>	<b>Know-how protection: Copy protection error</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF1
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The know-how protection with copy protection for the memory card is active. An error has occurred when checking the memory card. Fault value (r0949, interpret decimal): 0: A memory card is not inserted. 1: An invalid memory card is inserted (not SIEMENS). 2: An invalid memory card is inserted. 3: The memory card is being used in another Control Unit. 12: An invalid memory card is inserted (OEM input incorrect, p7769). 13: The memory card is being used in another Control Unit (OEM input incorrect, p7759). See also: p7765 (KHP configuration)
<b>Remedy:</b>	For fault value = 0, 1: - insert the correct memory card and carry out POWER ON. For fault value = 2, 3, 12, 13: - contact the responsible OEM. - De-activate copy protection (p7765) and acknowledge the fault (p3981). - De-activate know-how protection (p7766 ... p7768) and acknowledge the fault (p3981). Note: In general, the copy protection can only be changed when know-how protection is de-activated. KHP: Know-How Protection See also: p3981 (Faults acknowledge drive object), p7765 (KHP configuration)
<hr/>	
<b>F13101</b>	<b>Know-how protection: Copy protection cannot be activated</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	An error occurred when attempting to activate the copy protection for the memory card. Fault value (r0949, interpret decimal): 0: A memory card is not inserted. 1: An invalid memory card is inserted (not SIEMENS). Note: KHP: Know-How Protection
<b>Remedy:</b>	- insert a valid memory card. - Try to activate copy protection again (p7765). See also: p7765 (KHP configuration)

<b>F13102</b>	<b>Know-how protection: Consistency error of the protected data</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF1
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	An error was identified when checking the consistency of the protected files. As a consequence, the project on the memory card cannot be run. Fault value (r0949, interpret hexadecimal): yyyyxxxx hex: yyyy = object number, xxxx = fault cause xxxx = 1: A file has a checksum error. xxxx = 2: The files are not consistent with one another. xxxx = 3: The project files, which were loaded into the file system via load (download from the memory card), are inconsistent. Note: KHP: Know-How Protection
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- Replace the project on the memory card or replace project files for download from the memory card.</li><li>- Restore the factory setting and download again.</li></ul>

---

<b>F30001</b>	<b>Power unit: Overcurrent</b>
<b>Message class:</b>	Power electronics faulted (5)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The power unit has detected an overcurrent condition. <ul style="list-style-type: none"><li>- closed-loop control is incorrectly parameterized.</li><li>- motor has a short-circuit or fault to ground (frame).</li><li>- U/f operation: Up ramp set too low.</li><li>- U/f operation: rated current of motor much greater than that of power unit.</li><li>- High discharge and post-charging current for line supply voltage interruptions.</li><li>- High post-charging currents for overload when motoring and DC link voltage dip.</li><li>- short-circuit currents at switch-on due to the missing line reactor.</li><li>- power cables are not correctly connected.</li><li>- power cables exceed the maximum permissible length.</li><li>- power unit defective.</li><li>- line phase interrupted.</li></ul> Fault value (r0949, interpret bitwise binary): Bit 0: Phase U. Bit 1: Phase V. Bit 2: Phase W. Bit 3: Overcurrent in the DC link. Note: Fault value = 0 means that the phase with overcurrent is not recognized.
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- check the motor data - if required, carry out commissioning.</li><li>- check the motor circuit configuration (star/delta).</li><li>- U/f operation: Increase up ramp.</li><li>- U/f operation: Check assignment of rated currents of motor and power unit.</li><li>- check the line supply quality.</li><li>- reduce motor load.</li><li>- correct connection of line reactor.</li><li>- check the power cable connections.</li><li>- check the power cables for short-circuit or ground fault.</li><li>- check the length of the power cables.</li><li>- replace power unit.</li><li>- check the line supply phases.</li></ul>

**F30002 Power unit: DC link voltage overvoltage**

**Message class:** DC-link overvoltage (4)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The power unit has detected an overvoltage condition in the DC link.

- motor regenerates too much energy.
- line supply voltage too high.
- line phase interrupted.
- DC-link voltage control switched off.
- dynamic response of DC-link voltage controller excessive or insufficient.

Fault value (r0949, interpret decimal):

DC link voltage at the time of trip [0.1 V].

**Remedy:**

- increase the ramp-down time (p1121).
- set the rounding times (p1130, p1136). This is particularly recommended in U/f operation to relieve the DC link voltage controller with rapid ramp-down times of the ramp-function generator.
- Activate the DC link voltage controller (p1240, p1280).
- adapt the dynamic response of the DC-link voltage controller (p1243, p1247, p1283, p1287).
- check the line supply and DC link voltage. set p0210 as low as possible (also see A07401, p1294 = 0).
- check and correct the phase assignment at the power unit.
- check the line supply phases.

See also: p0210 (Drive unit line supply voltage), p1240 (Vdc controller configuration (vector control))

---

**F30003 Power unit: DC link voltage undervoltage**

**Message class:** Infeed faulted (13)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The power unit has detected an undervoltage condition in the DC link.

- line supply failure
- line supply voltage below the permissible value.
- line phase interrupted.

**Note:**

The monitoring threshold for the DC link undervoltage is the minimum of the following values:

- for a calculation, refer to p0210.

**Remedy:**

- check the line supply voltage
- check the line supply phases.

See also: p0210 (Drive unit line supply voltage)

---

**F30004 Power unit: Overtemperature heat sink AC inverter**

**Message class:** Power electronics faulted (5)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The temperature of the power unit heat sink has exceeded the permissible limit value.

- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.
- pulse frequency too high.

Fault value (r0949, interpret decimal):

Temperature [1 bit = 0.01 °C].

**Remedy:**

- check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.
- check the motor load.
- reduce the pulse frequency if this is higher than the rated pulse frequency.

<b>F30005</b>	<b>Power unit: Overload I2t</b>
<b>Message class:</b>	Power electronics faulted (5)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The power unit was overloaded (r0036 = 100 %). <ul style="list-style-type: none"><li>- the permissible rated power unit current was exceeded for an inadmissibly long time.</li><li>- the permissible load duty cycle was not maintained.</li></ul> Fault value (r0949, interpret decimal): I2t [100 % = 16384].
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- reduce the continuous load.</li><li>- adapt the load duty cycle.</li><li>- check the motor and power unit rated currents.</li><li>- reduce the current limit (p0640).</li><li>- during operation with U/f characteristic: reduce the integral time of the current limiting controller (p1341).</li></ul> See also: r0036 (Power unit overload I2t), r0206 (Rated power unit power), p0307 (Rated motor power)

---

<b>F30011</b>	<b>Power unit: Line phase failure in main circuit</b>
<b>Message class:</b>	Network fault (2)
<b>Reaction:</b>	OFF2 (OFF1)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	At the power unit, the DC link voltage ripple has exceeded the permissible limit value. Possible causes: <ul style="list-style-type: none"><li>- a line phase has failed.</li><li>- the 3 line phases are inadmissibly unsymmetrical.</li><li>- the capacitance of the DC link capacitor forms a resonance frequency with the line inductance and the reactor integrated in the power unit.</li><li>- the fuse of a phase of a main circuit has ruptured.</li><li>- a motor phase has failed.</li></ul> Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- check the main circuit fuses.</li><li>- check whether a single-phase load is distorting the line voltages.</li><li>- Detune the resonant frequency with the line inductance by using an upstream line reactor.</li><li>- Dampen the resonant frequency with the line inductance by switching over the DC link voltage compensation in the software (see p1810) – or increase the smoothing (see p1806). However, this can have a negative impact on the torque ripple at the motor output.</li><li>- check the motor feeder cables.</li></ul>

---

<b>F30015 (N, A)</b>	<b>Power unit: Phase failure motor cable</b>
<b>Message class:</b>	Application/technological function faulted (17)
<b>Reaction:</b>	OFF2 (NONE, OFF1, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A phase failure in the motor feeder cable was detected. The signal can also be output in the following cases: <ul style="list-style-type: none"><li>- the motor is correctly connected, but the drive has stalled in U/f control. In this case, a current of 0 A is possibly measured in one phase due to asymmetry of the currents.</li><li>- the motor is correctly connected, however the closed-speed control is instable and therefore an oscillating torque is generated.</li></ul> Note: Chassis power units do not feature phase failure monitoring.

- Remedy:**
- check the motor feeder cables.
  - increase the ramp-up or ramp-down time (p1120) if the drive has stalled in U/f control.
  - check the speed controller settings.

---

**A30016 (N) Power unit: Load supply switched out**

**Message class:** Network fault (2)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The DC link voltage is too low.  
Alarm value (r2124, interpret decimal):  
DC link voltage at the time of trip [0.1 V].

**Remedy:** Under certain circumstances, the AC line supply is not switched on.

---

**F30017 Power unit: Hardware current limit has responded too often**

**Message class:** Power electronics faulted (5)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The hardware current limitation in the relevant phase (see A30031, A30032, A30033) has responded too often. The number of times the limit has been exceeded depends on the design and type of power unit.

- closed-loop control is incorrectly parameterized.
- fault in the motor or in the power cables.
- the power cables exceed the maximum permissible length.
- motor load too high
- power unit defective.

Fault value (r0949, interpret binary):  
Bit 0: Phase U  
Bit 1: Phase V  
Bit 2: Phase W

**Remedy:**

- check the motor data.
- check the motor circuit configuration (star-delta).
- check the motor load.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.
- replace power unit.

---

**F30021 Power unit: Ground fault**

**Message class:** Ground fault / inter-phase short-circuit detected (7)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The power has detected a ground fault.  
Possible causes:

- ground fault in the power cables.
- ground fault at the motor.
- CT defective.
- when the brake closes, this causes the hardware DC current monitoring to respond.
- short-circuit at the braking resistor.

Fault value (r0949, interpret decimal):  
0:  
- the hardware DC current monitoring has responded.  
- short-circuit at the braking resistor.  
> 0:  
Absolute value, summation current [32767 = 271 % rated current].

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

- Remedy:**
- check the power cable connections.
  - check the motor.
  - check the CT.
  - check the cables and contacts of the brake connection (a wire is possibly broken).
  - check the braking resistor.
- See also: p0287 (Ground fault monitoring thresholds)

---

#### **F30022**      **Power unit: Monitoring U<sub>ce</sub>**

**Message class:** Ground fault / inter-phase short-circuit detected (7)

**Reaction:** OFF2

**Acknowledge:** POWER ON

**Cause:** In the power unit, the monitoring of the collector-emitter voltage (U<sub>ce</sub>) of the semiconductor has responded.

Possible causes:

- fiber-optic cable interrupted.
- power supply of the IGBT gating module missing.
- short-circuit at the power unit output.
- defective semiconductor in the power unit.

Fault value (r0949, interpret binary):

Bit 0: Short-circuit in phase U

Bit 1: Short circuit in phase V

Bit 2: Short-circuit in phase W

Bit 3: Light transmitter enable defective

Bit 4: U<sub>ce</sub> group fault signal interrupted

See also: r0949 (Fault value)

- Remedy:**
- check the fiber-optic cable and if required, replace.
  - check the power supply of the IGBT gating module (24 V).
  - check the power cable connections.
  - select the defective semiconductor and replace.

#### **F30024**      **Power unit: Overtemperature thermal model**

**Message class:** Power electronics faulted (5)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The temperature difference between the heat sink and chip has exceeded the permissible limit value.

- the permissible load duty cycle was not maintained.
- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.
- pulse frequency too high.

See also: r0037 (Power unit temperatures)

- Remedy:**
- adapt the load duty cycle.
  - check whether the fan is running.
  - check the fan elements.
  - check whether the ambient temperature is in the permissible range.
  - check the motor load.
  - reduce the pulse frequency if this is higher than the rated pulse frequency.
  - if DC braking is active: reduce braking current (p1232).

<b>F30025</b>	<b>Power unit: Chip overtemperature</b>
<b>Message class:</b>	Power electronics faulted (5)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The chip temperature of the semiconductor has exceeded the permissible limit value. - the permissible load duty cycle was not maintained. - insufficient cooling, fan failure. - overload. - ambient temperature too high. - pulse frequency too high. Fault value (r0949, interpret decimal): Temperature difference between the heat sink and chip [0.01 °C].
<b>Remedy:</b>	- adapt the load duty cycle. - check whether the fan is running. - check the fan elements. - check whether the ambient temperature is in the permissible range. - check the motor load. - reduce the pulse frequency if this is higher than the rated pulse frequency. Notice: This fault can only be acknowledged after the alarm threshold for alarm A05001 has been undershot. See also: r0037 (Power unit temperatures)

<b>F30027</b>	<b>Power unit: Precharging DC link time monitoring</b>
<b>Message class:</b>	Infeed faulted (13)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The power unit DC link was not able to be precharged within the expected time. 1) There is no line supply voltage connected. 2) The line contactor/line side switch has not been closed. 3) The line supply voltage is too low. 4) Line supply voltage incorrectly set (p0210). 5) The precharging resistors are overheated as there were too many precharging operations per time unit. 6) The precharging resistors are overheated as the DC link capacitance is too high. 7) The DC link has either a ground fault or a short-circuit. 8) Precharging circuit may be defective. Fault value (r0949, interpret binary): yyyyxxxx hex: yyyy = power unit state 0: Fault status (wait for OFF and fault acknowledgment). 1: Restart inhibit (wait for OFF). 2: Overvoltage condition detected -> change into the fault state. 3: Undervoltage condition detected -> change into the fault state. 4: Wait for bridging contactor to open -> change into the fault state. 5: Wait for bridging contactor to open -> change into restart inhibit. 6: Commissioning. 7: Ready for precharging. 8: Precharging started, DC link voltage less than the minimum switch-on voltage. 9: Precharging, DC link voltage end of precharging still not detected. 10: Wait for the end of the de-bounce time of the main contactor after precharging has been completed. 11: Precharging completed, ready for pulse enable. 12: Reserved. xxxx = Missing internal enable signals, power unit (inverted bit-coded, FFFF hex -> all internal enable signals available) Bit 0: Power supply of the IGBT gating shut down. Bit 1: Ground fault detected.

- Bit 2: Peak current intervention.
- Bit 3: I<sub>2t</sub> exceeded.
- Bit 4: Thermal model overtemperature calculated.
- Bit 5: (heat sink, gating module, power unit) overtemperature measured.
- Bit 6: Reserved.
- Bit 7: Overvoltage detected.
- Bit 8: Power unit has completed precharging, ready for pulse enable.
- Bit 9: Reserved.
- Bit 10: Overcurrent detected.
- Bit 11: Reserved.
- Bit 12: Reserved.
- Bit 13: V<sub>ce</sub> fault detected, transistor de-saturated due to overcurrent/short-circuit.
- Bit 14: Undervoltage detected.

See also: p0210 (Drive unit line supply voltage)

**Remedy:**

In general:

- check the line supply voltage at the input terminals.
- check the line supply voltage setting (p0210).
- wait until the precharging resistors have cooled down. For this purpose, preferably disconnect the infeed unit from the line supply.

For 5):

- carefully observe the permissible precharging frequency (refer to the appropriate Equipment Manual).

For 6):

- check the capacitance of the DC link and, if necessary, reduce it in accordance with the maximum permissible DC link capacitance (see relevant Equipment Manual).

For 7):

- check the DC link for a ground fault or short circuit.

#### **A30030 Power unit: Internal overtemperature alarm**

**Message class:** Power electronics faulted (5)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The temperature inside the drive converter has exceeded the permissible temperature limit.

- insufficient cooling, fan failure.
- overload.

- ambient temperature too high.

Alarm value (r2124, interpret decimal):

Only for internal Siemens troubleshooting.

**Remedy:**

- possibly use an additional fan.
- check whether the ambient temperature is in the permissible range.

Notice:

This fault can only be acknowledged once the permissible temperature limit minus 5 K has been fallen below.

---

#### **A30031 Power unit: Hardware current limiting in phase U**

**Message class:** Power electronics faulted (5)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Hardware current limit for phase U responded. The pulsing in this phase is inhibited for one pulse period.

- closed-loop control is incorrectly parameterized.
- fault in the motor or in the power cables.
- the power cables exceed the maximum permissible length.
- motor load too high
- power unit defective.

Note:

Alarm A30031 is always output if, for a Power Module, the hardware current limiting of phase U, V or W responds.

---

- Remedy:**
- check the motor data and if required, recalculate the control parameters (p0340 = 3). As an alternative, run a motor data identification (p1910 = 1, p1960 = 1).
  - check the motor circuit configuration (star/delta).
  - check the motor load.
  - check the power cable connections.
  - check the power cables for short-circuit or ground fault.
  - check the length of the power cables.

---

### **A30032 Power unit: Hardware current limiting in phase V**

**Message class:** Power electronics faulted (5)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Hardware current limit for phase V responded. The pulsing in this phase is inhibited for one pulse period.

- closed-loop control is incorrectly parameterized.
- fault in the motor or in the power cables.
- the power cables exceed the maximum permissible length.
- motor load too high
- power unit defective.

**Note:**

Alarm A30031 is always output if, for a Power Module, the hardware current limiting of phase U, V or W responds.

**Remedy:** Check the motor data and if required, recalculate the control parameters (p0340 = 3). As an alternative, run a motor data identification (p1910 = 1, p1960 = 1).

- check the motor circuit configuration (star/delta).
- check the motor load.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.

---

### **A30033 Power unit: Hardware current limiting in phase W**

**Message class:** Power electronics faulted (5)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Hardware current limit for phase W responded. The pulsing in this phase is inhibited for one pulse period.

- closed-loop control is incorrectly parameterized.
- fault in the motor or in the power cables.
- the power cables exceed the maximum permissible length.
- motor load too high
- power unit defective.

**Note:**

Alarm A30031 is always output if, for a Power Module, the hardware current limiting of phase U, V or W responds.

**Remedy:** Check the motor data and if required, recalculate the control parameters (p0340 = 3). As an alternative, run a motor data identification (p1910 = 1, p1960 = 1).

- check the motor circuit configuration (star/delta).
- check the motor load.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

#### **A30034 Power unit: Internal overtemperature**

**Message class:** Power electronics faulted (5)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The alarm threshold for internal overtemperature has been reached.  
If the temperature inside the unit continues to increase, fault F30036 may be triggered.  
- ambient temperature might be too high.  
- insufficient cooling, fan failure.  
Alarm value (r2124, interpret decimal):  
Only for internal Siemens troubleshooting.  
**Remedy:**  
- check the ambient temperature.  
- check the fan for the inside of the unit.

---

#### **F30036 Power unit: Internal overtemperature**

**Message class:** Power electronics faulted (5)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** The temperature inside the drive converter has exceeded the permissible temperature limit.  
- insufficient cooling, fan failure.  
- overload.  
- ambient temperature too high.  
Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.  
**Remedy:**  
- check whether the fan is running.  
- check the fan elements.  
- check whether the ambient temperature is in the permissible range.  
Notice:  
This fault can only be acknowledged once the permissible temperature limit minus 5 K has been fallen below.

---

#### **A30042 Power unit: Fan has reached the maximum operating hours**

**Message class:** Power electronics faulted (5)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The maximum operating time of at least one fan will soon be reached, or has already been exceeded.  
Alarm value (r2124, interpret binary):  
Bit 0: heat sink fan will reach the maximum operating time in 500 hours.  
Bit 1: heat sink fan has exceeded the maximum operating time.  
Bit 8: internal device fan will reach the maximum operating time in 500 hours.  
Bit 9: internal device fan has exceeded the maximum operating time.  
Note:  
The maximum operating time of the heat sink fan in the power unit is displayed in p0252.  
The maximum operating time of the internal device fan in the power unit is internally specified and is fixed.  
**Remedy:** For the fan involved, carry out the following:  
- replace the fan.  
- reset the operating hours counter (p0251, p0254).

---

#### **F30051 Power unit: Motor holding brake short circuit detected**

**Message class:** External measured value / signal state outside the permissible range (16)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** A short-circuit at the motor holding brake terminals has been detected.  
Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.  
**Remedy:**  
- check the motor holding brake for a short-circuit.  
- check the connection and cable for the motor holding brake.

---

<b>F30052</b>	<b>EEPROM data error</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	POWER ON
<b>Cause:</b>	EEPROM data error of the power unit module. Fault value (r0949, interpret decimal): 0, 2, 3, 4: The EEPROM data read in from the power unit module is inconsistent. 1: EEPROM data is not compatible to the firmware of the Control Unit.
<b>Remedy:</b>	Replace power unit module.

---

<b>A30054 (F, N)</b>	<b>Power unit: Undervoltage when opening the brake</b>
<b>Message class:</b>	Supply voltage fault (undervoltage) (3)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	When the brake is being opened, it is detected that the power supply voltage is less than 21.4 V Alarm value (r2124, interpret decimal): Supply voltage fault [0.1 V]. Example: Alarm value = 195 --> voltage = 19.5 V
<b>Remedy:</b>	Check the 24 V voltage for stability and value.

---

<b>A30057</b>	<b>Power unit: Line asymmetry</b>
<b>Message class:</b>	Network fault (2)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	Frequencies have been detected on the DC link voltage that would suggest line asymmetry or failure of a line phase. It is also possible that a motor phase has failed. Fault F30011 is output if the alarm is present and at the latest after 5 minutes. The precise duration depends on the power unit type and the particular frequencies. For booksize and chassis power units, the duration also depends on how long the alarm has been active. Alarm value (r2124, interpret decimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- check the line phase connection. - check the motor feeder cable connections. If there is no phase failure of the line or motor, then line asymmetry is involved. - reduce the power in order to avoid fault F30011.

---

<b>A30065 (F, N)</b>	<b>Voltage measured values not plausible</b>
<b>Message class:</b>	Power electronics faulted (5)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The voltage measurement is not supplying any plausible values Alarm value (r2124, interpret bitwise binary): Bit 1: Phase U. Bit 2: Phase V. Bit 3: Phase W.
<b>Remedy:</b>	- De-activate voltage measurement (p0247.0 = 0). - De-activate flying restart with voltage measurement (p0247.5 = 0) and de-activate fast flying restart (p1780.11 = 0).

<b>F30071</b>	<b>No new actual values received from the Power Module</b>
<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	More than one actual value telegram from the power unit module has failed.
<b>Remedy:</b>	Check the interface (adjustment and locking) to the power unit module.
<b>F30072</b>	<b>Setpoints can no longer be transferred to the Power Module</b>
<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	More than one setpoint telegram was not able to be transferred to the power unit module.
<b>Remedy:</b>	Check the interface (adjustment and locking) to the power unit module.
<b>F30074 (A)</b>	<b>Communication error between the Control Unit and Power Module</b>
<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	Communications between the Control Unit (CU) and Power Module (PM) via the interface no longer possible. The CU may have been withdrawn or is incorrectly inserted. Fault value (r0949, interpret hexadecimal): 0 hex: - a Control Unit with external 24 V supply was withdrawn from the Power Module during operation. - with the Power Module switched off, the external 24 V supply for the Control Unit was interrupted for some time. 1 hex: The Control Unit was withdrawn from the Power Module during operation, although the encoderless safe motion monitoring functions are enabled. This is not supported. After re-inserting the Control Unit in operation, communications to the Power Module no longer possible. 20A hex: The Control Unit was inserted on a Power Module, which has another code number. 20B hex: The Control Unit was inserted on a Power Module, which although it has the same code number, has a different serial number. The Control Unit executes an automatic warm restart to accept the new calibration data.
<b>Remedy:</b>	For fault value = 0 and 20A hex: Insert the Control Unit on an appropriate Power Module and continue operation. If required, carry out a POWER ON of the Control Unit. For fault value = 1 hex: Carry out a POWER ON of the Control Unit.
<b>F30075</b>	<b>Configuration of the power unit unsuccessful</b>
<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A communication error has occurred while configuring the power unit using the Control Unit. The cause is not clear. Fault value (r0949, interpret decimal): 0: The output filter initialization was unsuccessful. 1: Activation/de-activation of the regenerative feedback functionality was unsuccessful.
<b>Remedy:</b>	- acknowledge the fault and continue operation. - if the fault reoccurs, carry out a POWER ON (switch-off/switch-on). - if required, replace the power unit.

---

**F30080 Power unit: Current increasing too quickly**

- Message class:** Power electronics faulted (5)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** The power unit has detected an excessive rate of rise in the overvoltage range.
- closed-loop control is incorrectly parameterized.
  - motor has a short-circuit or fault to ground (frame).
  - U/f operation: Up ramp set too low.
  - U/f operation: rated current of motor much greater than that of power unit.
  - power cables are not correctly connected.
  - power cables exceed the maximum permissible length.
  - power unit defective.
- Fault value (r0949, interpret bitwise binary):  
Bit 0: Phase U.  
Bit 1: Phase V.  
Bit 2: Phase W.
- Remedy:**
- check the motor data - if required, carry out commissioning.
  - check the motor circuit configuration (star-delta)
  - U/f operation: Increase up ramp.
  - U/f operation: Check assignment of rated currents of motor and power unit.
  - check the power cable connections.
  - check the power cables for short-circuit or ground fault.
  - check the length of the power cables.
  - replace power unit.

---

**F30081 Power unit: Switching operations too frequent**

- Message class:** Power electronics faulted (5)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** The power unit has executed too many switching operations for current limitation.
- closed-loop control is incorrectly parameterized.
  - motor has a short-circuit or fault to ground (frame).
  - U/f operation: Up ramp set too low.
  - U/f operation: rated current of motor much greater than that of power unit.
  - power cables are not correctly connected.
  - power cables exceed the maximum permissible length.
  - power unit defective.
- Fault value (r0949, interpret bitwise binary):  
Bit 0: Phase U.  
Bit 1: Phase V.  
Bit 2: Phase W.
- Remedy:**
- check the motor data - if required, carry out commissioning.
  - check the motor circuit configuration (star-delta)
  - U/f operation: Increase up ramp.
  - U/f operation: Check assignment of rated currents of motor and power unit.
  - check the power cable connections.
  - check the power cables for short-circuit or ground fault.
  - check the length of the power cables.
  - replace power unit.

<b>F30105</b>	<b>PU: Actual value sensing fault</b>
<b>Message class:</b>	Power electronics faulted (5)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	At least one incorrect actual value channel was detected on the Power Stack Adapter (PSA). The incorrect actual value channels are displayed in the following diagnostic parameters.
<b>Remedy:</b>	Evaluate the diagnostic parameters. If the actual value channel is incorrect, check the components and if required, replace.

---

<b>A30502</b>	<b>Power unit: DC link overvoltage</b>
<b>Message class:</b>	DC-link overvoltage (4)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The power unit has detected overvoltage in the DC link on a pulse inhibit. - device connection voltage too high. - line reactor incorrectly dimensioned. Alarm value (r0949, interpret decimal): DC link voltage [1 bit = 100 mV]. See also: r0070 (Actual DC link voltage)
<b>Remedy:</b>	- check the device supply voltage (p0210). - check the dimensioning of the line reactor. See also: p0210 (Drive unit line supply voltage)

<b>F30600</b>	<b>SI P2: STOP A initiated</b>
<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The drive-integrated "Safety Integrated" function on processor 2 has detected an error and initiated a STOP A. - forced checking procedure (test stop) of the safety switch-off signal path on processor 2 unsuccessful. - subsequent response to fault F30611 (defect in a monitoring channel). Fault value (r0949, interpret decimal): 0: Stop request from processor 1. 1005: - Pulses suppressed although STO not selected and there is no internal STOP A present. - For a Power Module with "STO via terminals at the Power Module" (STO_A/STO_B), these terminals are active (DIP switch to "ON"). However, the "STO via terminals at the Power Module" function has not been enabled (p9601.7 = p9801.7 = 0). 1010: Pulses enabled although STO is selected or an internal STOP A is present. 1011: Internal fault for the pulse enable in the Power Module. 1030: Feedback signal of the safety switch-off signal paths for the "STO via terminals at the Power Module" function different. 9999: Subsequent response to fault F30611.
<b>Remedy:</b>	- select Safe Torque Off and de-select again. - carry out a POWER ON (switch-off/switch-on) for all components. - replace Power Module involved. For fault value = 1005: - de-activate terminals STO_A/STO_B on the Power Module (set both DIP-switches to "OFF") or enable the "STO via terminals at the Power Module" function. For fault value = 1030: - check the discrepancy time, and if required, increase the value (p9650/p9850). - check the STO terminal at the Power Module (contact problems). For fault value = 9999: - carry out diagnostics for fault F30611.

<b>N30620 (F, A)</b>	<b>SI P2: Safe Torque Off active</b>
<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The "Safe Torque Off" (STO) function has been selected on processor 2 using the input terminal and is active. Note: This message does not result in a safety stop response.
<b>Remedy:</b>	Not necessary. Note: STO: Safe Torque Off

<b>F30625</b>	<b>SI P2: Sign-of-life error in safety data</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The drive-integrated "Safety Integrated" function on processor 2 has detected an error in the sign-of-life of the safety data and initiated a STOP A. - there is a communication error between processor 1 and processor 2 or communication has failed. - a time slice overflow of the safety software has occurred. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- select Safe Torque Off and de-select again. - carry out a POWER ON (switch-off/switch-on). - check whether additional faults are present and if required, perform diagnostics. - check the electrical cabinet design and cable routing for EMC compliance

<b>F30630</b>	<b>SI P2: Brake control error</b>
<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The "Safety Integrated" function integrated in the drive on processor 2 (P2) has detected a brake control error and initiated a STOP A. - motor cable is not shielded correctly. - defect in the Safe Brake Module, in the Power Module or in the Control Unit. Fault value (r0949, interpret decimal): 10: Fault in "open holding brake" operation. - parameter p1278 incorrectly set. - no brake connected or wire breakage (check whether brake releases for p1278 = 1 and p9602/p9802 = 0 (SBC deactivated)). - ground fault in brake cable.

30:

Fault in "close holding brake" operation.

- no brake connected or wire breakage (check whether brake releases for p1278 = 1 and p9602/p9802 = 0 (SBC deactivated)).

- short-circuit in brake winding.

40:

Fault in "brake closed" state.

60, 70:

Fault in the brake control circuit of processor 1 or communication error between processor 1 and processor 2 (brake control diagnostics).

**Remedy:**

- check parameter p1278 (for SBC, only p1278 = 0 is permissible).

- select Safe Torque Off and de-select again.

- check the motor holding brake connection.

- check the function of the motor holding brake.

- check the Safe Brake Module connection.

- check that the electrical cabinet design and cable routing are in compliance with EMC regulations (e.g. shield of the motor cable and brake conductors are connected with the shield connecting plate and the motor connectors are tightly screwed to the housing).

- replace the Safe Brake Module.

- replace Power Module.

- replace the Control Unit.

**F30649****SI P2: Internal software error****Message class:** Hardware/software error (1)**Reaction:** OFF2**Acknowledge:** IMMEDIATELY (POWER ON)**Cause:** An internal error in the Safety Integrated software on processor 2 has occurred.

Note:

This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret hexadecimal):

Only for internal Siemens troubleshooting.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).

- re-commission the "Safety Integrated" function and carry out a POWER ON.

- contact Technical Support.

- replace Control Unit.

**F30650****SI P2: Acceptance test required****Message class:** Error in the parameterization / configuration / commissioning procedure (18)**Reaction:** OFF2**Acknowledge:** IMMEDIATELY (POWER ON)**Cause:** The drive-integrated "Safety Integrated" function on processor 2 requires an acceptance test.

Note:

This fault results in a STOP A that can be acknowledged.

Fault value (r0949, interpret decimal):

130: Safety parameters for processor 2 not available.

Note:

This fault value is always output when Safety Integrated is commissioned for the first time.

1000: Reference and actual checksum on processor 2 are not identical (booting).

- at least one checksum-checked piece of data is defective.

- safety parameters set offline and loaded into the Control Unit.

2000: Reference and actual checksum on processor 2 are not identical (commissioning mode).

- reference checksum incorrectly entered on processor 2 (p9899 not equal to r9898).

- 2003: Acceptance test is required as a safety parameter has been changed.

## 4 Faults and alarms

### 4.2 List of faults and alarms

2010: Enable of safety-related brake control between the two monitoring channels differ (p9602 not equal to p9802).  
9999: Subsequent response of another safety-related fault that occurred when booting that requires an acceptance test.

**Remedy:**

For fault value = 130:

- carry out safety commissioning routine.

For fault value = 1000:

- again carry out safety commissioning routine.

- replace the memory card or Control Unit.

- Using STARTER, activate the safety parameters for the drive involved (change settings, copy parameters, activate settings).

For fault value = 2000:

- check the safety parameters on processor 2 and adapt the reference checksum (p9899).

For fault value = 2003:

- carry out an acceptance test and generate an acceptance report.

For fault value = 2010:

- check the enable the safety-related brake control on both monitoring channels (p9602 = p9802).

For fault value = 9999:

- carry out diagnostics for the other safety-related fault that is present.

#### **F30656 SI P2: Parameter processor 2 parameter error**

**Message class:** Hardware/software error (1)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** When accessing the Safety Integrated parameters for the processor 2 in the non-volatile memory, an error has occurred.

Note:

This fault results in a STOP A that can be acknowledged.

Fault value (r0949, interpret decimal):  
129: Safety parameters for processor 2 corrupted.  
131: Internal software error on processor 1.  
255: Internal software error on processor 2.

**Remedy:**

- re-commission the safety functions.
  - replace the memory card or Control Unit.
- For fault value = 129:
- activate the safety commissioning mode (p0010 = 95).
  - start the copy function for SI parameters (p9700 = D0 hex).
  - acknowledge data change (p9701 = DC hex).
  - exit the safety commissioning mode (p0010 = 0).
  - save all parameters (p0971 = 1 or "copy RAM to ROM").
  - carry out a POWER ON (switch-off/switch-on) for the Control Unit.

**F30659**      **SI P2: Write request for parameter rejected**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The write request for one or several Safety Integrated parameters on processor 2 was rejected.

**Note:**

This fault does not result in a safety stop response.

Fault value (r0949, interpret decimal):

10: An attempt was made to enable the STO function although this cannot be supported.

15: An attempt was made to enable the motion monitoring functions integrated in the drive although these cannot be supported.

16: An attempt was made to enable the PROFIsafe communications although this cannot be supported.

18: An attempt was made to enable the PROFIsafe function for Basic Functions although this cannot be supported.

20: An attempt was made to simultaneously enable both the drive-integrated motion monitoring functions via integrated F-DI and STO via terminals, even though these cannot be supported at the same time.

28: An attempt was made to enable the "STO via terminals at the Power Module" function although this cannot be supported.

See also: r9771 (SI common functions (processor 1)), r9871 (SI common functions (processor 2))

**Remedy:**

For fault value = 10, 15, 16, 18:

- check whether there are faults in the safety function alignment (F01655, F30655) and if required, carry out diagnostics for the faults involved.

- use a Control Unit that supports the required function.

For fault value = 28:

- use the power unit with the feature "STO via terminals at the Power Module".

**Message class:** Hardware/software error (1)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** A system defect was detected before the last boot or in the actual one. The system might have been rebooted (reset).  
Fault value (r0949, interpret hexadecimal):  
40 hex:  
- For a Power Module with "STO via terminals at the Power Module" (STO\_A/STO\_B), these terminals are active (DIP switch to "ON"). However, the "STO via terminals at the Power Module" function has not been enabled (p9601.7 = p9801.7 = 0).  
200000 hex, 4000yy hex:  
- fault in the actual booting/operation.  
Additional values:  
- defect before the last time that the system booted.  
**Remedy:**  
- carry out a POWER ON (switch-off/switch-on).  
- upgrade firmware to later version.  
- contact Technical Support.  
For fault value = 40 hex:  
- de-activate terminals STO\_A/STO\_B on the Power Module (set both DIP-switches to "OFF") or enable the "STO via terminals at the Power Module" function.  
For fault value = 4000yy hex:  
- ensure that the Control Unit is connected to the Power Module.  
- deselect the "STO via terminals at the Power Module" function.

**A30666 (F) SI Motion P2: Steady-state (static) 1 signal at the F-DI for safe acknowledgment**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** A logical 1 signal is present at the F-DI configured in p10106 for more than 10 seconds.  
If, at the F-DI no acknowledgment was performed for safe acknowledgment, then a steady-state logical and 0 signal must be present. This avoids unintentional safety-relevant acknowledgment (or the "Internal Event Acknowledge" signal) if a wire breaks or one of the two digital inputs bounces.  
**Remedy:** Set the fail-safe digital input (F-DI) to a logical 0 signal (p10106).

**C30700 SI Motion P2: STOP A initiated**

**Message class:** Safety monitoring channel has identified an error (10)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The drive is stopped via a STOP A (pulses are suppressed via the safety switch-off signal path of processor 1).  
Possible causes:  
- stop request from processor 1.  
- Pulses not suppressed after test stop selection.  
- subsequent response to the message C30706 "SI Motion P2: SAM/SBR limit exceeded".  
- subsequent response to the message C30714 "SI Motion P2: Safely Limited Speed exceeded".  
- subsequent response to the message C30701 "SI Motion P2: STOP B initiated".

**Remedy:**  
- remove the cause of the fault on the monitoring channel of processor 1.  
- check the switch-off signal path of processor 2.  
- carry out a diagnostics routine for message C30706.

#### C30711

#### SI Motion P2: Defect in a monitoring channel

**Message class:** Safety monitoring channel has identified an error (10)

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.

If at least one monitoring function is active, then message C30701 "SI Motion: STOP B initiated" is output.

The following message values may also occur in the following cases if the cause that is explicitly mentioned does not apply:

- synchronization error between processor 1 and processor 2.

Message value (r2124, interpret decimal):

0 ... 999:

Number of the cross-compared data that resulted in this message.

The significance of the individual message values is described in safety message C01711.

1000: Watchdog timer has expired. Too many signal changes have occurred at the F-DI.

1001: Initialization error of watchdog timer.

1011: Acceptance test status between the monitoring channels differ.

1020: Cyc. communication failure between the monit. cycles.

1040: Pulses suppressed with active encoderless monitoring functions.

1041: Current absolute value too low (encoderless)

1042: Current/voltage plausibility error

1043: Too many acceleration phases

1044: Actual current values plausibility error.

See also: r9725 (SI Motion diagnostics STOP F)

**Remedy:** For message value = 1040:

- de-select encoderless monitoring functions, select and de-select STO.

- if monitoring function is active, issue "SLS" pulse enable within 5 s of de-selecting STO.

For other message values:

- the significance of the individual message values is described in safety message C01711.

Note:

This message can be acknowledged using "Acknowledge internal event".

#### C30712

#### SI Motion P2: Defect in F-IO processing

**Message class:** Safety monitoring channel has identified an error (10)

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** When cross checking and comparing the two monitoring channels, the drive detected a difference between parameters or results of the F-IO processing and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.

The safety message C30711 with message value 0 is also displayed due to initiation of STOP F.

If at least one monitoring function is active, then safety message C30701 "SI Motion: STOP B initiated" is output.

Message value (r2124, interpret decimal):

Number of the cross-compared data that resulted in this message.

See safety message C01712 for a description of the message values.

**Remedy:**

- check parameterization in the parameters involved and correct if required.
- ensure equality by copying the SI data to processor 2 and then carry out an acceptance test.

**Note:**  
This message can be acknowledged via F-DI or PROFIsafe.

---

**C30714**      **SI Motion P2: Safely limited speed exceeded**

**Message class:** Safety monitoring channel has identified an error (10)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The drive had moved faster than that specified by the velocity limit value (p9331). The drive is stopped as a result of the configured stop response (p9363).  
Message value (r2124, interpret decimal):  
100: SLS1 exceeded.  
200: SLS2 exceeded.  
300: SLS3 exceeded.  
400: SLS4 exceeded.

**Remedy:**

- check the traversing/motion program in the control.
- check the limits for "SLS" function and if required, adapt (p9331).

**Note:**  
This message can be acknowledged using "Acknowledge internal event".  
SLS: Safely Limited Speed

**C30716**      **SI Motion P2: Tolerance for safe motion direction exceeded**

**Message class:** Safety monitoring channel has identified an error (10)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The tolerance for the "safe motion direction" function was exceeded. The drive is stopped as a result of the configured stop response (p9366).  
Message value (r2124, interpret decimal):  
0: Tolerance for the "safe motion direction positive" function exceeded.  
1: Tolerance for the "safe motion direction negative" function exceeded.

**Remedy:**

- check the traversing/motion program in the control.
- check the tolerance for "SDI" function and if required, adapt (p9364).

This message can be acknowledged as follows:

- Deselect the "SDI" function and select again.
- carry out safe acknowledgment via "Acknowledgment internal event".

**Note:**  
SDI: Safe Direction (safe motion direction)

**C30770**      **SI Motion P2: Discrepancy error affecting the failsafe inputs**

**Message class:** Safety monitoring channel has identified an error (10)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The fail-safe digital inputs (F-DI) show a different state longer than that parameterized in p10002 / p10102.  
Fault value (r0949, interpret binary):  
Bit 0: Discrepancy error for F-DI 0  
Bit 1: Discrepancy error for F-DI 1  
...

**Note:**  
If several discrepancy errors occur consecutively, then this message is only signaled for the first error that occurs.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:** - check the wiring of the F-DI (contact problems).

**Note:**  
This message can be acknowledged via F-DI or PROFIsafe.  
Discrepancy errors of an F-DI can only be acknowledged if safe acknowledgment was carried out once after the cause of the error was resolved (p10106, acknowledgment via PROFIsafe, extended message acknowledgment). As long as safety acknowledgment was not carried out, the corresponding F-DI stays in the safe state internally.  
When the "Extended message acknowledgment" function (p9307.0) is active, the following applies:  
If the F-DI assigned for STO or SS1 is in a fail-safe state due to a discrepancy error, then when deselecting via this F-DI, safe acknowledgment can no longer be executed.  
For cyclic switching operations at the F-DI, it may be necessary to adapt the discrepancy time to the switching frequency.  
If the period of a cyclic switching pulse corresponds to twice the value of p10102, then the following formulas should be checked:  
-  $p10102 < (tp / 2) - td$  (discrepancy time must be less than half the period minus the actual discrepancy time)  
-  $p10102 \geq 12 \text{ ms}$  (discrepancy time must be no less than 12 ms)  
-  $p10102 > td$  (discrepancy time must be greater than the switch discrepancy time that may actually occur)  
 $td$  = possible actual discrepancy time (in ms) that can occur with a switching operation. It must be at least 12 ms.  
 $tp$  = period for a switching operation in ms.  
When debounce p10117 is active, the discrepancy time is directly specified by the debounce time.  
If the period of a cyclic switching pulse corresponds to twice the debounce time, then the following formulas should be checked.  
-  $p10102 < p10117 + 1 \text{ ms} - td$   
-  $p10102 > td$   
-  $p10102 \geq 12 \text{ ms}$   
**Example:**  
For a 110 ms switching frequency and  $p10117 = 0$ , the maximum discrepancy time that can be set is as follows:  
 $p10102 \leq (110/2 \text{ ms}) - 12 \text{ ms} = 43 \text{ ms}$   
Rounded off,  $p10102 \leq 36 \text{ ms}$  is obtained (as the discrepancy time is rounded off as a multiple of 12 ms).

**Message class:** Safety monitoring channel has identified an error (10)

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** A fault has occurred on processor 2 during the forced checking procedure (test stop) of the fail-safe digital output.  
Fault value (r0949, interpret hexadecimal):  
RRRVWXYZ hex:  
R: Reserved.  
V: Actual state of the DO channel concerned (see X) on processor 2 (corresponds to the states read back from the hardware, bit 0 = DO 0, bit 1 = DO 1, etc.).  
W: Required state of the DO channel concerned (see X, bit 0 = DO 0, bit 1 = DO 1, etc.).  
X: DO channels involved, which indicate an error (bit 0 = DO 0, bit 1 = DO 1, etc.).  
Y: Reason for the test stop fault.  
Z: State of the test stop in which the fault has occurred.

Y: Reason for the test stop fault

Y = 1: Processor 1 in incorrect test stop state (internal fault).

Y = 2: Expected states of the DOs were not fulfilled (CU240D-2: readback via DI 5 / CU250S-2 readback via DI 6).

Y = 3: Incorrect timer state on processor 1 (internal fault)

Y = 4: Expected states of the diag DOs were not fulfilled (CU240D-2: internal readback on processor 1 channel / CU250S-2 readback via DI6).

Y = 5: Expected states of the second diag DOs were not fulfilled (CU240D-2: internal readback on processor 2).

X and V indicate the DI or Diag-DO state dependent upon the reason for the fault (2, 4 or 5).

In the event of multiple test stop faults, the first one that occurred is shown.

Z: Test stop state and associated test actions

Z = 0 ... 3: Synchronization phase of test stop between processor 1 and processor 2 no switching operations

Z = 4: DO + OFF and DO - OFF

Z = 5: Check to see if states are as expected

Z = 6: DO + ON and DO - ON

Z = 7: Check to see if states are as expected

Z = 8: DO + OFF and DO - ON

Z = 9: Check to see if states are as expected

Z = 10: DO + ON and DO - OFF

Z = 11: Check to see if states are as expected

Z = 12: DO + OFF and DO - OFF

Z = 13: Check to see if states are as expected

Z = 14: End of test stop

DI expected states in table format:

Test stop state: Expectation Mode 1 / Mode 2 / Mode 3 / Mode 4

5: -/1/1/-

7: -/0/0/-

9: -/0/1/-

11: -/0/1/-

13: -/1/1/-

Example:

Fault F01773 (P1) is signaled with fault value = 0001\_0127 and fault F30773 (P2) is signaled with fault value 0000\_0127.

This means that in state 7 (Z = 7) the state of the external readback signal was not set correctly (Y = 2) after DO-0 (X = 1) was switched to ON/ON.

Fault value 0001\_0127 indicates that 0 was expected (W = 0) and 1 (V = 1) was read back from the hardware.

Fault value 0000\_0127 on the processor 2 indicates that the states were as expected.

In the case of fault F30773, W and V are always identical; a value of 0 always means that 0 was expected at the readback input but was not present on processor 1.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

**Remedy:** Check the wiring of the fail-safe digital output (F-DO) and restart the test stop.  
**Note:**  
- the fault is withdrawn if the test stop is successfully completed.  
- in the event of multiple test stop faults, the first one that occurred is shown. Once the test stop has been restarted the next queued test stop fault will be signaled (if there is one).  
F-DO: Failsafe Digital Output

#### **A30788 Automatic test stop: wait for STO deselection via SMM**

**Message class:** Safety monitoring channel has identified an error (10)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The automatic test stop was not able to be carried out after powering up.  
**Possible causes:**  
- the STO function is selected via Safety Extended Functions.  
- a safety message is present, that resulted in a STO.  
**Remedy:**  
- Deselect STO via Safety Extended Functions.  
- remove the cause of the safety messages and acknowledge the messages.  
The automatic test stop is performed after removing the cause.

#### **C30798 SI Motion P2: Test stop for motion monitoring functions running**

**Message class:** Safety monitoring channel has identified an error (10)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The forced checking procedure (test stop) for the safe motion monitoring functions is currently in progress.  
**Remedy:** Not necessary.  
The message is automatically withdrawn when the test stop has been completed.  
**Note:**  
SI: Safety Integrated

**A30920 (F)**      **Temperature sensor fault**  
**Message class:** Power electronics faulted (5)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** When evaluating the temperature sensor, an error occurred.  
Alarm value (r2124, interpret decimal):  
1: Wire breakage or sensor not connected.  
KTY: R > 2120 Ohm, PT1000: R > 2120 Ohm  
2: Measured resistance too low.  
PTC: R < 20 Ohm, KTY: R < 50 Ohm, PT1000: R < 603 Ohm  
**Remedy:** - make sure that the sensor is connected correctly.  
- replace the sensor.

**F30950**      **Power unit: Internal software error**  
**Message class:** Hardware/software error (1)  
**Reaction:** OFF2  
**Acknowledge:** POWER ON  
**Cause:** An internal software error has occurred.  
Fault value (r0949, interpret decimal):  
Information about the fault source.  
Only for internal Siemens troubleshooting.  
**Remedy:** - if necessary, upgrade the firmware in the power unit to a later version.  
- contact Technical Support.

---

**A30999 (F, N)**      **Power unit: Unknown alarm**  
**Message class:** Power electronics faulted (5)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** An alarm occurred on the power unit that cannot be interpreted by the Control Unit firmware.  
This can occur if the firmware on this component is more recent than the firmware on the Control Unit.  
Alarm value (r2124, interpret decimal):  
Alarm number.  
Note:  
If required, the significance of this new alarm can be read about in a more recent description of the Control Unit.  
**Remedy:** - replace the firmware on the power unit by an older firmware version (r0128).  
- upgrade the firmware on the Control Unit (r0018).

<b>F31100 (N, A)</b>	<b>Encoder 1: Zero mark distance error</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	ENCODER (IASC/DCBRK, NONE, OFF1, OFF2, OFF3, STOP2)
<b>Acknowledge:</b>	PULSE INHIBIT
<b>Cause:</b>	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance. See also: p0491 (Motor encoder fault response ENCODER)
<b>Remedy:</b>	<ul style="list-style-type: none"> <li>- check that the encoder cables are routed in compliance with EMC.</li> <li>- check the plug connections.</li> <li>- check the encoder type (encoder with equidistant zero marks).</li> <li>- adapt the parameter for the distance between zero marks (p0424, p0425).</li> <li>- if message output above speed threshold, reduce filter time if necessary (p0438).</li> <li>- replace the encoder or encoder cable.</li> </ul>

<b>F31101 (N, A)</b>	<b>Encoder 1: Zero mark failed</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	ENCODER (IASC/DCBRK, NONE, OFF1, OFF2, OFF3, STOP2)
<b>Acknowledge:</b>	PULSE INHIBIT
<b>Cause:</b>	The 1.5 x parameterized zero mark distance was exceeded. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Number of increments after POWER ON or since the last zero mark that was detected (4 increments = 1 encoder pulse). <b>F31103 (N, A)</b>	<b>Encoder 1: Amplitude error track R</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	ENCODER (IASC/DCBRK, NONE)
<b>Acknowledge:</b>	PULSE INHIBIT
<b>Cause:</b>	The amplitude of the reference track signal (track R) does not lie within the tolerance bandwidth for encoder 1. The fault can be initiated when the unipolar voltage level is exceeded (RP/RN) or if the differential amplitude is undershot. Fault value (r0949, interpret hexadecimal): yyyyxxxx hex: yyyy = 0, xxxx = Signal level, track R (16 bits with sign) The response thresholds of the unipolar signal levels of the encoder are between < 1400 mV and > 3500 mV. The response threshold for the differential signal level of the encoder is < -1600 mV. A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec. Note: The analog value of the amplitude error is not measured at the same time with the hardware fault output by the Sensor Module. The fault value can only be represented between -32768 ... 32767 dec (-770 ... 770 mV).

The signal level is not evaluated unless the following conditions are satisfied:

- Sensor Module properties available (r0459.31 = 1).
- Monitoring active (p0437.31 = 1).

See also: p0491 (Motor encoder fault response ENCODER)

**Remedy:**

- check the speed range; frequency characteristic (amplitude characteristic) of the measuring equipment might not be sufficient for the speed range
- check that the encoder cables and shielding are routed in compliance with EMC.
- check the plug connections and contacts of the encoder cable.
- check the encoder type (encoder with zero marks).
- check whether the zero mark is connected and the signal cables RP and RN have been connected correctly.
- replace the encoder cable.
- if the coding disk is soiled or the lighting aged, replace the encoder.

**F31110 (N, A)**

**Encoder 1: Serial communications error**

**Message class:**

Actual position/speed value incorrect or not available (11)

**Reaction:**

ENCODER (IASC/DCBRK, NONE)

**Acknowledge:**

PULSE INHIBIT

**Cause:**

Serial communication protocol transfer error between the encoder and evaluation module.

Fault value (r0949, interpret binary):

Bit 0: Alarm bit in the position protocol.

Bit 1: Incorrect quiescent level on the data line.

Bit 2: Encoder does not respond (does not supply a start bit within 50 ms).

Bit 3: CRC error: The checksum in the protocol from the encoder does not match the data.

Bit 4: Encoder acknowledgment error: The encoder incorrectly understood the task (request) or cannot execute it.

Bit 5: Internal error in the serial driver: An illegal mode command was requested.

Bit 6: Timeout when cyclically reading.

Bit 7: Timeout for the register communication.

Bit 8: Protocol is too long (e.g. > 64 bits).

Bit 9: Receive buffer overflow.

Bit 10: Frame error when reading twice.

Bit 11: Parity error.

Bit 12: Data line signal level error during the monoflop time.

Bit 13: Data line incorrect.

Bit 14: Fault for the register communication.

Bit 15: Internal communication error.

Note:

For an EnDat 2.2 encoder, the significance of the fault value for F3x135 (x = 1, 2, 3) is described.

**Remedy:**

For fault value, bit 0 = 1:

- Enc defect F31111 may provide additional details.

For fault value, bit 1 = 1:

- incorrect encoder type / replace the encoder or encoder cable.

For fault value, bit 2 = 1:

- incorrect encoder type / replace the encoder or encoder cable.

For fault value, bit 3 = 1:

- EMC / connect the cable shield, replace the encoder or encoder cable.

For fault value, bit 4 = 1:

- EMC / connect the cable shield, replace the encoder or encoder cable, replace the Sensor Module.

For fault value, bit 5 = 1:

- EMC / connect the cable shield, replace the encoder or encoder cable, replace the Sensor Module.

For fault value, bit 6 = 1:

- Update Sensor Module firmware.

For fault value, bit 7 = 1:

- incorrect encoder type / replace the encoder or encoder cable.

For fault value, bit 8 = 1:

- check parameterization (p0429.2).

- For fault value, bit 9 = 1:
  - EMC / connect the cable shield, replace the encoder or encoder cable, replace the Sensor Module.
- For fault value, bit 10 = 1:
  - check parameterization (p0429.2, p0449).
- For fault value, bit 11 = 1:
  - check parameterization (p0436).
- For fault value, bit 12 = 1:
  - check parameterization (p0429.6).
- For fault value, bit 13 = 1:

<b>F31115 (N, A)</b>	<b>Encoder 1: Amplitude error track A or B (<math>A^2 + B^2</math>)</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	ENCODER (IASC/DCBRK, NONE)
<b>Acknowledge:</b>	PULSE INHIBIT
<b>Cause:</b>	The amplitude (root of $A^2 + B^2$ ) for encoder 1 exceeds the permissible tolerance. Fault value (r0949, interpret hexadecimal): yyyyxxxx hex: yyyy = Signal level, track B (16 bits with sign). xxxx = Signal level, track A (16 bits with sign). The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %). The response thresholds are < 170 mV (observe the frequency response of the encoder) and > 750 mV. A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec. Note for Sensor Modules for resolvers (e.g. SMC10): The nominal signal level is at 2900 mV (2.0 Vrms). The response thresholds are < 1070 mV and > 3582 mV. A signal level of 2900 mV peak value corresponds to the numerical value 6666 hex = 26214 dec. Note when using the internal resolver evaluation (CU250S): The nominal signal level is at 1300 mV. The response thresholds are < 490 mV and > 1616 mV. A signal level of 1300 mV peak value corresponds to the numerical value 2DE6 hex = 11750 dec. Note: The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module. See also: p0491 (Motor encoder fault response ENCODER)
<b>Remedy:</b>	- check that the encoder cables and shielding are routed in compliance with EMC. - check the plug connections. - replace the encoder or encoder cable. - check the Sensor Module (e.g. contacts). The following applies to measuring systems without their own bearing system: - adjust the scanning head and check the bearing system of the measuring wheel. The following applies for measuring systems with their own bearing system: - ensure that the encoder housing is not subject to any axial force.

<b>F31116 (N, A)</b>	<b>Encoder 1: Amplitude error monitoring track A + B</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	ENCODER (IASC/DCBRK, NONE)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The amplitude of the rectified encoder signals A and B and the amplitude from the roots of $A^2 + B^2$ for encoder 1 are not within the tolerance bandwidth.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Signal level, track B (16 bits with sign).

xxxx = Signal level, track A (16 bits with sign).

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response thresholds are < 130 mV (observe the frequency response of the encoder) and > 955 mV.

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

See also: p0491 (Motor encoder fault response ENCODER)

**Remedy:**

- check that the encoder cables and shielding are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- check the Sensor Module (e.g. contacts).

**F31117 (N, A) Encoder 1: Inversion error signals A/B/R**

**Message class:** Actual position/speed value incorrect or not available (11)

**Reaction:** ENCODER (IASC/DCBRK, NONE)

**Acknowledge:** IMMEDIATELY

**Cause:** For a square-wave encoder (bipolar, double ended) signals A\*, B\* and R\* are not inverted with respect to signals A, B and R.

Fault value (r0949, interpret binary):

Bits 0 ... 15: Only for internal Siemens troubleshooting.

Bit 16: Error track A.

Bit 17: Error track B.

Bit 18: Error track R.

Note:

For SMC30 (order no.. 6SL3055-0AA00-5CA0 and 6SL3055-0AA00-5CA1 only), CUA32, and CU310, the following applies:

A square-wave encoder without track R is used and track monitoring (p0405.2 = 1) is activated.

See also: p0491 (Motor encoder fault response ENCODER)

**Remedy:**

- check the encoder/cable.
- Does the encoder supply signals and the associated inverted signals?

Note:

For SMC30 (order no. 6SL3055-0AA00-5CA0 and 6SL3055-0AA00-5CA1 only), the following applies:

- check the setting of p0405 (p0405.2 = 1 is only possible if the encoder is connected at X520).

For a square-wave encoder without track R, the following jumpers must be set for the connection at X520 (SMC30) or X23 (CUA32, CU310):

- pin 10 (reference signal R) <--> pin 7 (encoder power supply, ground)
- pin 11 (reference signal R inverted) <--> pin 4 (encoder power supply)

**Cause:** The unipolar level (AP/AN or BP/BN) for encoder 1 is outside the permissible tolerance.

Fault value (r0949, interpret binary):

Bit 0 = 1: Either AP or AN outside the tolerance.

Bit 16 = 1: Either BP or BN outside the tolerance.

The unipolar nominal signal level of the encoder must lie in the range 2500 mV +/- 500 mV.

The response thresholds are < 1700 mV and > 3300 mV.

Note:

The signal level is not evaluated unless the following conditions are satisfied:

xxxx = Signal level, track A (16 bits with sign).

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold is > 750 mV. This fault also occurs if the analog/digital converter is overcontrolled.

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note for Sensor Modules for resolvers (e.g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is > 3582 mV.

A signal level of 2900 mV peak value corresponds to the numerical value 6666 hex = 26214 dec.

Note when using the internal resolver evaluation (CU250S):

The nominal signal level is at 1300 mV. The response threshold is > 1616 mV.

A signal level of 1300 mV peak value corresponds to the numerical value 2DE6 hex = 11750 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

**Encoder 1: Position difference hall sensor/track C/D and A/B too large**

**Message class:**

Actual position/speed value incorrect or not available (11)

**Reaction:**

ENCODER (IASC/DCBRK, NONE)

**Acknowledge:**

PULSE INHIBIT

**Cause:**

The error for track C/D is greater than  $\pm 15^\circ$  mechanical or  $\pm 60^\circ$  electrical or the error for the Hall signals is greater than  $\pm 60^\circ$  electrical.

One period of track C/D corresponds to  $360^\circ$  mechanical.

One period of the Hall signal corresponds to  $360^\circ$  electrical.

The monitoring responds if, for example, Hall sensors are connected as equivalent for the C/D tracks with the incorrect rotational sense or supply values that are not accurate enough.

After the fine synchronization using one reference mark or 2 reference marks for distance-coded encoders, this fault is no longer initiated, but instead, Alarm A31429.

Fault value (r0949, interpret decimal):

For track C/D, the following applies:

Measured deviation as mechanical angle (16 bits with sign, 182 dec corresponds to  $1^\circ$ ).

For Hall signals, the following applies:

Measured deviation as electrical angle (16 bits with sign, 182 dec corresponds to  $1^\circ$ ).

See also: p0491 (Motor encoder fault response ENCODER)

**Remedy:**

- track C or D not connected.
- correct the direction of rotation of the Hall sensor possibly connected as equivalent for track C/D.
- check that the encoder cables are routed in compliance with EMC.
- check the adjustment of the Hall sensor.

**Cause:**

After initializing the pole position using track C/D, Hall signals or pole position identification routine, the zero mark was detected outside the permissible range. For distance-coded encoders, the test is carried out after passing 2 zero marks. Fine synchronization was not carried out.

When initializing via track C/D (p0404) then it is checked whether the zero mark occurs in an angular range of  $\pm 18^\circ$  mechanical.

When initializing via Hall sensors (p0404) or pole position identification (p1982) it is checked whether the zero mark occurs in an angular range of  $\pm 60^\circ$  electrical.

Fault value (r0949, interpret hexadecimal):

- 1: Position value from the LVDT sensor.
- 2: Position value from the encoder characteristic.

**Remedy:** For fault value = 1:  
- check the LVDT ratio (p4678).  
- check the reference signal connection at track B.  
For fault value = 2:  
- check the coefficients of the characteristic (p4663 ... p4666).

<b>A31400 (F, N)</b>	<b>Encoder 1: Alarm threshold zero mark distance error</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Alarm value (r2124, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance.
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- check that the encoder cables are routed in compliance with EMC.</li><li>- check the plug connections.</li><li>- check the encoder type (encoder with equidistant zero marks).</li><li>- adapt the parameter for the distance between zero marks (p0424, p0425).</li><li>- replace the encoder or encoder cable.</li></ul>
<b>A31401 (F, N)</b>	<b>Encoder 1: Alarm threshold zero mark failed</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The 1.5 x parameterized zero mark distance was exceeded. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Alarm value (r2124, interpret decimal): Number of increments after POWER ON or since the last zero mark that was detected (4 increments = 1 encoder pulse).
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- check that the encoder cables are routed in compliance with EMC.</li><li>- check the plug connections.</li><li>- check the encoder type (encoder with equidistant zero marks).</li><li>- adapt the parameter for the clearance between zero marks (p0425).</li><li>- replace the encoder or encoder cable.</li></ul>

**Cause:** Serial communication protocol transfer error between the encoder and evaluation module.  
Alarm value (r2124, interpret binary):  
Bit 0: Alarm bit in the position protocol.  
Bit 1: Incorrect quiescent level on the data line.  
Bit 2: Encoder does not respond (does not supply a start bit within 50 ms).  
Bit 3: CRC error: The checksum in the protocol from the encoder does not match the data.  
Bit 4: Encoder acknowledgment error: The encoder incorrectly understood the task (request) or cannot execute it.  
Bit 5: Internal error in the serial driver: An illegal mode command was requested.  
Bit 6: Timeout when cyclically reading.  
Bit 8: Protocol is too long (e.g. > 64 bits).  
Bit 9: Receive buffer overflow.  
Bit 10: Frame error when reading twice.  
Bit 11: Parity error.  
Bit 12: Data line signal level error during the monoflop time.  
**Remedy:**  
- check that the encoder cables are routed in compliance with EMC.  
- check the plug connections.  
- replace encoder.

<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The amplitude (C <sup>2</sup> + D <sup>2</sup> ) of track C or D of the encoder or from the Hall signals, is not within the tolerance bandwidth. Alarm value (r2124, interpret hexadecimal): yyyyxxxx hex: yyyy = Signal level, track D (16 bits with sign). xxxx = Signal level, track C (16 bits with sign). The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %). The response thresholds are < 230 mV (observe the frequency response of the encoder) and > 750 mV. A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec. Note: If the amplitude is not within the tolerance bandwidth, then it cannot be used to initialize the start position.
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- check that the encoder cables are routed in compliance with EMC.</li><li>- check the plug connections.</li><li>- replace the encoder or encoder cable.</li><li>- check the Sensor Module (e.g. contacts).</li><li>- check the Hall sensor box.</li></ul>

<b>N31415 (F, A)</b>	<b>Encoder 1: Amplitude alarm track A or B (A<sup>2</sup> + B<sup>2</sup>)</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The amplitude (root of A <sup>2</sup> + B <sup>2</sup> ) for encoder 1 exceeds the permissible tolerance. Alarm value (r2124, interpret hexadecimal): yyyyxxxx hex: yyyy = Angle xxxx = amplitude, i.e. root of A <sup>2</sup> + B <sup>2</sup> (16 bits without sign) The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %). The response threshold is < 230 mV (observe the frequency response of the encoder). A signal level of 500 mV peak value corresponds to the numerical value 299A hex = 10650 dec. The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B. Note for Sensor Modules for resolvers (e.g. SMC10): The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1414 mV (1.0 Vrms). A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec. Note when using the internal resolver evaluation (CU250S): The nominal signal level is at 1300 mV. The response threshold is < 650 mV. A signal level of 1300 mV peak value corresponds to the numerical value 16F3 hex = 5875 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

See also: p0491 (Motor encoder fault response ENCODER)

Remedy:

- check the speed range, frequency characteristic (amplitude characteristic) of the measuring equipment is not sufficient for the speed range.
- check that the encoder cables and shielding are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- check the Sensor Module (e.g. contacts).
- if the coding disk is soiled or the lighting aged, replace the encoder.

**A31418 (F, N) Encoder 1: Speed difference per sampling rate exceeded**

**Message class:** Actual position/speed value incorrect or not available (11)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** For an HTL/TTL encoder, the speed difference between two sampling cycles has exceeded the value in p0492. The change to the averaged speed actual value - if applicable - is monitored in the current controller sampling time.

Alarm value (r2124, interpret decimal):

Only for internal Siemens troubleshooting.

See also: p0492 (Maximum speed difference per sampling cycle)

Remedy:

- check the tachometer feeder cable for interruptions.
- check the grounding of the tachometer shielding.
- if required, increase the setting of p0492.

<b>A31421 (F, N)</b>	<b>Encoder 1: Coarse position error</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	For the actual value sensing, an error was detected. As a result of this error, it must be assumed that the actual value sensing supplies an incorrect coarse position. Alarm value (r2124, interpret decimal): 3: The absolute position of the serial protocol and track A/B differ by half an encoder pulse. The absolute position must have its zero position in the quadrants in which both tracks are negative. In the case of a fault, the position can be incorrect by one encoder pulse.
<b>Remedy:</b>	For alarm value = 3: - For a standard encoder with cable, contact the manufacturer where relevant. - correct the assignment of the tracks to the position value that is serially transferred. To do this, the two tracks must be connected, inverted, at the Sensor Module (interchange A with A* and B with B*) or, for a programmable encoder, check the zero offset of the position.
<hr/>	
<b>A31422 (F, N)</b>	<b>Encoder 1: Pulses per revolution square-wave encoder outside tolerance bandwidth</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The measured zero mark distance does not correspond to the parameterized zero mark distance. This alarm is triggered with active square-wave encoder PPR correction and re-parameterized fault 31131 if the accumulator contains larger values than p4683 or p4684. The zero mark distance for zero mark monitoring is set in p0425 (rotary encoder). Alarm value (r2124, interpret decimal): accumulated differential pulses in encoder pulses. See also: p0491 (Motor encoder fault response ENCODER)
<b>Remedy:</b>	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the distance between zero marks (p0424, p0425). - replace the encoder or encoder cable.
<hr/>	
<b>A31429 (F, N)</b>	<b>Encoder 1: Position difference hall sensor/track C/D and A/B too large</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The error for track C/D is greater than +/-15 ° mechanical or +/-60 ° electrical or the error for the Hall signals is greater than +/-60 ° electrical. One period of track C/D corresponds to 360 ° mechanical. One period of the Hall signal corresponds to 360 ° electrical. The monitoring responds if, for example, Hall sensors are connected as equivalent for the C/D tracks with the incorrect rotational sense or supply values that are not accurate enough. Alarm value (r2124, interpret decimal): For track C/D, the following applies: Measured deviation as mechanical angle (16 bits with sign, 182 dec corresponds to 1 °). For Hall signals, the following applies: Measured deviation as electrical angle (16 bits with sign, 182 dec corresponds to 1 °). See also: p0491 (Motor encoder fault response ENCODER)
<b>Remedy:</b>	- track C or D not connected. - correct the direction of rotation of the Hall sensor possibly connected as equivalent for track C/D. - check that the encoder cables are routed in compliance with EMC. - check the adjustment of the Hall sensor.

---

<b>A31431 (F, N)</b>	<b>Encoder 1: Deviation position incremental/absolute too large</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	When the zero pulse is passed, a deviation in the incremental position was detected. For equidistant zero marks, the following applies: - the first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark. For distance-coded zero marks, the following applies: - the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair. Alarm value (r2124, interpret decimal): Deviation in quadrants (1 pulse = 4 quadrants). See also: p0491 (Motor encoder fault response ENCODER)
<b>Remedy:</b>	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - replace the encoder or encoder cable. - Clean coding disk or remove strong magnetic fields.
<hr/>	
<b>A31432 (F, N)</b>	<b>Encoder 1: Rotor position adaptation corrects deviation</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	For track A/B, pulses have been lost or too many have been counted. These pulses are presently being corrected. Alarm value (r2124, interpret decimal): Last measured deviation of zero mark in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance.
<b>Remedy:</b>	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - replace the encoder or encoder cable. - check encoder limit frequency. - adapt the parameter for the distance between zero marks (p0424, p0425).
<hr/>	
<b>A31442 (F, N)</b>	<b>Encoder 1: Battery voltage pre-alarm</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	When switched-off, the encoder uses a battery to back up the multiturn information. The multiturn information can no longer be buffered if the battery voltage drops even further.
<b>Remedy:</b>	Replace battery.
<hr/>	
<b>A31443 (F, N)</b>	<b>Encoder 1: Unipolar CD signal level outside specification</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The unipolar level (CP/CN or DP/DN) for encoder 1 is outside the permissible tolerance. Alarm value (r2124, interpret binary): Bit 0 = 1: Either CP or CN outside the tolerance. Bit 16 = 1: Either DP or DN outside the tolerance. The unipolar nominal signal level of the encoder must lie in the range 2500 mV +/- 500 mV. The response thresholds are < 1700 mV and > 3300 mV.

### 4.2 List of faults and alarms

---

**Note:**

The signal level is not evaluated unless the following conditions are satisfied:

- Sensor Module properties available (r0459.31 = 1).
- Monitoring active (p0437.31 = 1).

See also: p0491 (Motor encoder fault response ENCODER)

**Remedy:**

- check that the encoder cables and shielding are routed in compliance with EMC.
  - check the plug connections and contacts of the encoder cable.
  - are the C/D tracks connected correctly (have the signal lines CP and CN or DP and DN been interchanged)?
  - replace the encoder cable.
- 

**A31460 (N) Encoder 1: Analog sensor channel A failed**

**Message class:** Actual position/speed value incorrect or not available (11)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The input voltage of the analog sensor is outside the permissible limits.

Alarm value (r2124, interpret decimal):

- 1: Input voltage outside detectable measuring range.
- 2: Input voltage outside measuring range set in p4673.
- 3: The absolute value of the input voltage has exceeded the range limit (p4676).

**Remedy:**

- For alarm value = 1:
- check the output voltage of the analog sensor.
- For alarm value = 2:
- check the voltage setting for each encoder period (p4673).
- For alarm value = 3:
- check the range limit setting and increase it if necessary (p4676).
- 

**A31461 (N) Encoder 1: Analog sensor channel B failed**

**Message class:** Actual position/speed value incorrect or not available (11)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The input voltage of the analog sensor is outside the permissible limits.

Alarm value (r2124, interpret decimal):

- 1: Input voltage outside detectable measuring range.
- 2: Input voltage outside the measuring range set in (p4675).
- 3: The absolute value of the input voltage has exceeded the range limit (p4676).

**Remedy:**

- For alarm value = 1:
- check the output voltage of the analog sensor.
- For alarm value = 2:
- check the voltage setting for each encoder period (p4675).
- For alarm value = 3:
- check the range limit setting and increase it if necessary (p4676).
- 

**A31462 (N) Encoder 1: Analog sensor no channel active**

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Channel A and B are not activated for the analog sensor.

**Remedy:**

- activate channel A and/or channel B (p4670).
  - check the encoder configuration (p0404.17).
- See also: p4670 (Analog sensor configuration)
-

---

<b>A31463 (N)</b>	<b>Encoder 1: Analog sensor position value exceeds limit value</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The position value has exceeded the permissible range of -0.5 ... +0.5. Alarm value (r2124, interpret decimal): 1: Position value from the LVDT sensor. 2: Position value from the encoder characteristic.
<b>Remedy:</b>	For alarm value = 1: - check the LVDT ratio (p4678). - check the reference signal connection at track B. For alarm value = 2: - check the coefficients of the characteristic (p4663 ... p4666).

---

<b>A31470 (F, N)</b>	<b>Encoder 1: Soiling detected</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	In the case of the alternative encoder system interface on the Sensor Module Cabinet 30 (SMC30), encoder soiling is signaled via a 0 signal at terminal X521.7.
<b>Remedy:</b>	- check the plug connections. - replace the encoder or encoder cable.

---

<b>F31500 (N, A)</b>	<b>Encoder 1: Position tracking traversing range exceeded</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions. For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421. For p0411.3 = 1, the maximum traversing range for the configured linear axis is pre-set (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).
<b>Remedy:</b>	The fault should be resolved as follows: - select encoder commissioning (p0010 = 4). - reset the position tracking as follows (p0411.2 = 1). - de-select encoder commissioning (p0010 = 0). The fault should then be acknowledged and the absolute encoder adjusted.

---

<b>F31501 (N, A)</b>	<b>Encoder 1: Position tracking encoder position outside tolerance window</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	When switched off, the drive/encoder was moved through a distance greater than was parameterized in the tolerance window. It is possible that there is no longer any reference between the mechanical system and encoder. Fault value (r0949, interpret decimal): Deviation (difference) to the last encoder position in increments of the absolute value. The sign designates the traversing direction. Note: The deviation (difference) found is also displayed in r0477. See also: p0413 (Measuring gear position tracking tolerance window), r0477 (Measuring gear position difference)

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:** Reset the position tracking as follows:

- select encoder commissioning (p0010 = 4).
- reset the position tracking as follows (p0411.2 = 1).
- de-select encoder commissioning (p0010 = 0).

The fault should then be acknowledged and, if necessary, the absolute encoder adjusted (p2507).  
See also: p0010 (Drive commissioning parameter filter), p2507 (LR absolute encoder adjustment status)

---

**F31502 (N, A) Encoder 1: Encoder with measuring gear without valid signals**

**Message class:** Actual position/speed value incorrect or not available (11)  
**Reaction:** OFF1 (OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** The encoder with measuring gear no longer provides any valid signals.  
**Remedy:** It must be ensured that all of the encoders, with mounted measuring gear, provide valid actual values in operation.

---

**F31503 (N, A) Encoder 1: Position tracking cannot be reset**

**Message class:** Actual position/speed value incorrect or not available (11)  
**Reaction:** OFF1 (NONE, OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** The position tracking for the measuring gear cannot be reset.  
**Remedy:** The fault should be resolved as follows:

- select encoder commissioning (p0010 = 4).
- reset the position tracking as follows (p0411.2 = 1).
- de-select encoder commissioning (p0010 = 0).

The fault should then be acknowledged and the absolute encoder adjusted.

**F31802 (N, A) Encoder 1: Time slice overflow**

**Message class:** Hardware/software error (1)  
**Reaction:** ENCODER (IASC/DCBRK, NONE)  
**Acknowledge:** IMMEDIATELY  
**Cause:** A time slice overflow has occurred in encoder 1.  
Fault value (r0949, interpret hexadecimal):  
yx hex: y = function involved (Siemens-internal fault diagnostics), x = time slice involved  
x = 9:  
Time slice overflow of the fast (current controller clock cycle) time slice.  
x = A:  
Time slice overflow of the average time slice.  
x = C:  
Time slice overflow of the slow time slice.  
yx = 3E7:  
Timeout when waiting for SYNO (e.g. unexpected return to non-cyclic operation).  
See also: p0491 (Motor encoder fault response ENCODER)  
**Remedy:** Increase the current controller sampling time  
Note:  
For a current controller sampling time = 31.25 µs, use an SMx20 with order number 6SL3055-0AA00-5xA3.

---

**F31805 (N, A) Encoder 1: EEPROM checksum error**

**Message class:** Hardware/software error (1)  
**Reaction:** ENCODER (IASC/DCBRK, NONE)  
**Acknowledge:** IMMEDIATELY  
**Cause:** Internal parameter data is corrupted.  
Fault value (r0949, interpret hexadecimal):  
01: EEPROM access error.  
02: Too many blocks in the EEPROM.  
See also: p0491 (Motor encoder fault response ENCODER)  
**Remedy:** Replace the module.

- Monitoring active (p0437.31 = 1).

**Remedy:**

- check the speed range; frequency characteristic (amplitude characteristic) of the measuring equipment might not be sufficient for the speed range
- check that the encoder cables and shielding are routed in compliance with EMC.
- check the plug connections and contacts of the encoder cable.
- check the encoder type (encoder with zero marks).
- check whether the zero mark is connected and the signal cables RP and RN have been connected correctly.
- replace the encoder cable.
- if the coding disk is soiled or the lighting aged, replace the encoder.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Signal level, track B (16 bits with sign).

xxxx = Signal level, track A (16 bits with sign).

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response thresholds are < 170 mV (observe the frequency response of the encoder) and > 750 mV.

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note for Sensor Modules for resolvers (e.g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms). The response thresholds are < 1070 mV and > 3582 mV.

A signal level of 2900 mV peak value corresponds to the numerical value 6666 hex = 26214 dec.

Note when using the internal resolver evaluation (CU250S):

The nominal signal level is at 1300 mV. The response thresholds are < 490 mV and > 1616 mV.

A signal level of 1300 mV peak value corresponds to the numerical value 2DE6 hex = 11750 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

**Remedy:**

- check that the encoder cables and shielding are routed in compliance with EMC.

- check the plug connections.

- replace the encoder or encoder cable.

- check the Sensor Module (e.g. contacts).

The following applies to measuring systems without their own bearing system:

- adjust the scanning head and check the bearing system of the measuring wheel.

The following applies for measuring systems with their own bearing system:

### 4.2 List of faults and alarms

---

**Note:**

The signal level is not evaluated unless the following conditions are satisfied:

- Sensor Module properties available (r0459.31 = 1).
- Monitoring active (p0437.31 = 1).

**Remedy:**

- make sure that the encoder cables and shielding are installed in an EMC-compliant manner.
- check the plug connections and contacts of the encoder cable.
- check the short-circuit of a signal cable with mass or the operating voltage.
- replace the encoder cable.

**F32125 (N, A)**

**Encoder 2: Amplitude error track A or B overcontrolled**

**Message class:**

Actual position/speed value incorrect or not available (11)

**Reaction:**

OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)

**Acknowledge:**

PULSE INHIBIT

**Cause:**

The amplitude of track A or B for encoder 2 exceeds the permissible tolerance band.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Signal level, track B (16 bits with sign).

xxxx = Signal level, track A (16 bits with sign).

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold is > 750 mV. This fault also occurs if the analog/digital converter is overcontrolled.

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note for Sensor Modules for resolvers (e.g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is > 3582 mV.

A signal level of 2900 mV peak value corresponds to the numerical value 6666 hex = 26214 dec.

Note when using the internal resolver evaluation (CU250S):

The nominal signal level is at 1300 mV. The response threshold is > 1616 mV.

A signal level of 1300 mV peak value corresponds to the numerical value 2DE6 hex = 11750 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

**Remedy:**

- check that the encoder cables and shielding are routed in compliance with EMC.
- replace the encoder or encoder cable.

**F32126 (N, A)**

**Encoder 2: Amplitude AB too high**

**Message class:**

Actual position/speed value incorrect or not available (11)

**Reaction:**

OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)

**Acknowledge:**

PULSE INHIBIT

**Cause:**

The amplitude (root of  $A^2 + B^2$  or  $|A| + |B|$ ) for encoder 2 exceeds the permissible tolerance.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Angle

xxxx = amplitude, i.e. root of  $A^2 + B^2$  (16 bits without sign)

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold for ( $|A| + |B|$ ) is > 1120 mV or the root of ( $A^2 + B^2$ ) > 955 mV.

A signal level of 500 mV peak value corresponds to the numerical value of 299A hex = 10650 dec.

The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

**Remedy:**

- check that the encoder cables and shielding are routed in compliance with EMC.
- replace the encoder or encoder cable.

Incremental encoder:

When the zero pulse is passed, a deviation in the incremental position was detected.

For equidistant zero marks, the following applies:

- the first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark.

For distance-coded zero marks, the following applies:

- the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair.

Fault value (r0949, interpret decimal):

**Remedy:**

- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- check whether the coding disk is dirty or there are strong ambient magnetic fields.
- adapt the parameter for the clearance between zero marks (p0425).
- if message output above speed threshold, reduce filter time if necessary (p0438).

**Message class:**

Actual position/speed value incorrect or not available (11)

**Reaction:**

OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)

**Acknowledge:**

PULSE INHIBIT

**Cause:**

The encoder supplies status information bit by bit in an internal status/fault word.

Some of these bits cause this fault to be triggered. Other bits are status displays. The status/fault word is displayed in the fault value.

Note regarding the bit designation:

The first designation is valid for DRIVE-CLiQ encoders, the second for EnDat 2.2 encoders.

---

**Remedy:**

For fault value = 1:  
- check the output voltage of the analog sensor.

For fault value = 2:  
- check the voltage setting for each encoder period (p4673).

For fault value = 3:  
- check the range limit setting and increase it if necessary (p4676).

#### **F32161 (N, A) Encoder 2: Analog sensor channel B failed**

**Message class:** Actual position/speed value incorrect or not available (11)

**Reaction:** OFF1 (IASC/DCBRK, NONE)

**Acknowledge:** PULSE INHIBIT

**Cause:** The input voltage of the analog sensor is outside the permissible limits.

Fault value (r0949, interpret decimal):

1: Input voltage outside detectable measuring range.

2: Input voltage outside the measuring range set in (p4675).

3: The absolute value of the input voltage has exceeded the range limit (p4676).

**Remedy:**

For fault value = 1:  
- check the output voltage of the analog sensor.

For fault value = 2:  
- check the voltage setting for each encoder period (p4675).

For fault value = 3:

**Cause:** The position value has exceeded the permissible range of -0.5 ... +0.5.

Fault value (r0949, interpret decimal):

1: Position value from the LVDT sensor.

2: Position value from the encoder characteristic.

**Remedy:**

For fault value = 1:  
- check the LVDT ratio (p4678).  
- check the reference signal connection at track B.

For fault value = 2:  
- check the coefficients of the characteristic (p4663 ... p4666).

---

#### **A32400 (F, N) Encoder 2: Alarm threshold zero mark distance error**

**Message class:** Actual position/speed value incorrect or not available (11)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The measured zero mark distance does not correspond to the parameterized zero mark distance.

For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system.

The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).

Alarm value (r2124, interpret decimal):

Last measured zero mark distance in increments (4 increments = 1 encoder pulse).

The sign designates the direction of motion when detecting the zero mark distance.

**Remedy:**

- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- check the encoder type (encoder with equidistant zero marks).
- adapt the parameter for the distance between zero marks (p0424, p0425).
- replace the encoder or encoder cable.

Bit 3: CRC error: The checksum in the protocol from the encoder does not match the data. Bit 4: Encoder acknowledgment error: The encoder incorrectly understood the task (request) or cannot execute it. Bit 5: Internal error in the serial driver: An illegal mode command was requested. Bit 6: Timeout when cyclically reading. Bit 8: Protocol is too long (e.g. > 64 bits). Bit 9: Receive buffer overflow. Bit 10: Frame error when reading twice.

## 4 Faults and alarms

### 4.2 List of faults and alarms

Bit 11: Parity error.  
Bit 12: Data line signal level error during the monoflop time.

**Remedy:**

- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- replace encoder.

#### **A32411 (F, N) Encoder 2: Absolute encoder signals internal alarms**

**Message class:** Actual position/speed value incorrect or not available (11)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The absolute encoder fault word includes alarm bits that have been set.  
Alarm value (r2124, interpret binary):  
yyyyxxxx hex: yyyy = supplementary information, xxxx = fault cause  
yyyy = 0:  
Bit 0: Frequency exceeded (speed too high).  
Bit 1: Temperature exceeded.  
Bit 2: Control reserve, lighting system exceeded.  
Bit 3: Battery discharged.  
Bit 4: Reference point passed.  
yyyy = 1:  
Bit 0: Signal amplitude outside the control range.  
Bit 1: Error multiturn interface  
Bit 2: Internal data error (singleturn/multiturn not with single steps).  
Bit 3: Error EEPROM interface.  
Bit 4: SAR converter error.  
Bit 5: Fault for the register data transfer.  
Bit 6: Internal error identified at the error pin (nErr).  
Bit 7: Temperature threshold exceeded or fallen below.

**Remedy:** Replace encoder.

---

#### **A32412 (F, N) Encoder 2: Error bit set in the serial protocol**

**Message class:** Actual position/speed value incorrect or not available (11)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The encoder sends a set error bit via the serial protocol.  
Alarm value (r2124, interpret binary):  
Bit 0: Fault bit in the position protocol.  
Bit 1: Alarm bit in the position protocol.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on) for all components.
- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- replace encoder.

---

#### **A32414 (F, N) Encoder 2: Amplitude error track C or D ( $C^2 + D^2$ )**

**Message class:** Actual position/speed value incorrect or not available (11)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The amplitude ( $C^2 + D^2$ ) of track C or D of the encoder or from the Hall signals, is not within the tolerance bandwidth.  
Alarm value (r2124, interpret hexadecimal):  
yyyyxxxx hex:  
yyyy = Signal level, track D (16 bits with sign).  
xxxx = Signal level, track C (16 bits with sign).  
The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).  
The response thresholds are < 230 mV (observe the frequency response of the encoder) and > 750 mV.  
A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

## Note:

If the amplitude is not within the tolerance bandwidth, then it cannot be used to initialize the start position.

**Remedy:**

- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- check the Sensor Module (e.g. contacts).
- check the Hall sensor box.

**N32415 (F, A) Encoder 2: Amplitude alarm track A or B ( $A^2 + B^2$ )**

**Message class:** Actual position/speed value incorrect or not available (11)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The amplitude (root of  $A^2 + B^2$ ) for encoder 2 exceeds the permissible tolerance.

Alarm value (r2124, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Angle

xxxx = amplitude, i.e. root of  $A^2 + B^2$  (16 bits without sign)

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold is < 230 mV (observe the frequency response of the encoder).

A signal level of 500 mV peak value corresponds to the numerical value 299A hex = 10650 dec.

The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B.

Note for Sensor Modules for resolvers (e.g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1414 mV (1.0 Vrms).

A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec.

Note when using the internal resolver evaluation (CU250S):

The nominal signal level is at 1300 mV. The response threshold is < 650 mV.

A signal level of 1300 mV peak value corresponds to the numerical value 16F3 hex = 5875 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

**Remedy:**

- check the speed range, frequency characteristic (amplitude characteristic) of the measuring equipment is not sufficient for the speed range.
- check that the encoder cables and shielding are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- check the Sensor Module (e.g. contacts).
- if the coding disk is soiled or the lighting aged, replace the encoder.

**A32418 (F, N) Encoder 2: Speed difference per sampling rate exceeded**

**Message class:** Actual position/speed value incorrect or not available (11)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** For an HTL/TTL encoder, the speed difference between two sampling cycles has exceeded the value in p0492.

The change to the averaged speed actual value - if applicable - is monitored in the current controller sampling time.

Alarm value (r2124, interpret decimal):

Only for internal Siemens troubleshooting.

See also: p0492 (Maximum speed difference per sampling cycle)

**Remedy:**

- check the tachometer feeder cable for interruptions.
- check the grounding of the tachometer shielding.
- if required, increase the setting of p0492.

<b>A32442 (F, N)</b>	<b>Encoder 2: Battery voltage pre-alarm</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE

<b>Remedy:</b>	Replace battery.

---

<b>A32443 (F, N)</b>	<b>Encoder 2: Unipolar CD signal level outside specification</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The unipolar level (CP/CN or DP/DN) for encoder 2 is outside the permissible tolerance. Alarm value (r2124, interpret binary): Bit 0 = 1: Either CP or CN outside the tolerance. Bit 16 = 1: Either DP or DN outside the tolerance. The unipolar nominal signal level of the encoder must lie in the range 2500 mV +/- 500 mV. The response thresholds are < 1700 mV and > 3300 mV. Note: The signal level is not evaluated unless the following conditions are satisfied: - Sensor Module properties available (r0459.31 = 1). - Monitoring active (p0437.31 = 1).
<b>Remedy:</b>	- check that the encoder cables and shielding are routed in compliance with EMC. - check the plug connections and contacts of the encoder cable. - are the C/D tracks connected correctly (have the signal lines CP and CN or DP and DN been interchanged)? - replace the encoder cable.

---

<b>A32460 (N)</b>	<b>Encoder 2: Analog sensor channel A failed</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The input voltage of the analog sensor is outside the permissible limits. Alarm value (r2124, interpret decimal): 1: Input voltage outside detectable measuring range. 2: Input voltage outside measuring range set in p4673. 3: The absolute value of the input voltage has exceeded the range limit (p4676).
<b>Remedy:</b>	For alarm value = 1: - check the output voltage of the analog sensor. For alarm value = 2: - check the voltage setting for each encoder period (p4673). For alarm value = 3: - check the range limit setting and increase it if necessary (p4676).

---

<b>A32461 (N)</b>	<b>Encoder 2: Analog sensor channel B failed</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The input voltage of the analog sensor is outside the permissible limits. Alarm value (r2124, interpret decimal): 1: Input voltage outside detectable measuring range. 2: Input voltage outside the measuring range set in (p4675). 3: The absolute value of the input voltage has exceeded the range limit (p4676).

**Remedy:** For alarm value = 1:  
- check the output voltage of the analog sensor.  
For alarm value = 2:  
- check the voltage setting for each encoder period (p4675).  
For alarm value = 3:  
- check the range limit setting and increase it if necessary (p4676).

**A32462 (N) Encoder 2: Analog sensor no channel active**  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** Channel A and B are not activated for the analog sensor.  
**Remedy:** - activate channel A and/or channel B (p4670).  
- check the encoder configuration (p0404.17).  
See also: p4670 (Analog sensor configuration)

---

**A32463 (N) Encoder 2: Analog sensor position value exceeds limit value**  
**Message class:** Actual position/speed value incorrect or not available (11)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The position value has exceeded the permissible range of -0.5 ... +0.5.  
Alarm value (r2124, interpret decimal):  
1: Position value from the LVDT sensor.  
2: Position value from the encoder characteristic.  
**Remedy:** For alarm value = 1:  
- check the LVDT ratio (p4678).  
- check the reference signal connection at track B.  
For alarm value = 2:  
- check the coefficients of the characteristic (p4663 ... p4666).

---

**A32470 (F, N) Encoder 2: Soiling detected**  
**Message class:** Actual position/speed value incorrect or not available (11)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** In the case of the alternative encoder system interface on the Sensor Module Cabinet 30 (SMC30), encoder soiling is signaled via a 0 signal at terminal X521.7.  
**Remedy:** - check the plug connections.  
- replace the encoder or encoder cable.

---

**F32500 (N, A) Encoder 2: Position tracking traversing range exceeded**  
**Message class:** Actual position/speed value incorrect or not available (11)  
**Reaction:** OFF1 (NONE, OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions.  
For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421.  
For p0411.3 = 1, the maximum traversing range for the configured linear axis is pre-set (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).  
**Remedy:** The fault should be resolved as follows:  
- select encoder commissioning (p0010 = 4).  
- reset the position tracking as follows (p0411.2 = 1).  
- de-select encoder commissioning (p0010 = 0).  
The fault should then be acknowledged and the absolute encoder adjusted.

<b>F32501 (N, A)</b>	<b>Encoder 2: Position tracking encoder position outside tolerance window</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	When switched off, the drive/encoder was moved through a distance greater than was parameterized in the tolerance window. It is possible that there is no longer any reference between the mechanical system and encoder. Fault value (r0949, interpret decimal): Deviation (difference) to the last encoder position in increments of the absolute value. The sign designates the traversing direction. Note: The deviation (difference) found is also displayed in r0477. See also: p0413 (Measuring gear position tracking tolerance window), r0477 (Measuring gear position difference)
<b>Remedy:</b>	Reset the position tracking as follows: - select encoder commissioning (p0010 = 4). - reset the position tracking as follows (p0411.2 = 1). - de-select encoder commissioning (p0010 = 0). The fault should then be acknowledged and, if necessary, the absolute encoder adjusted (p2507). See also: p0010 (Drive commissioning parameter filter), p2507 (LR absolute encoder adjustment status)

<b>F32502 (N, A)</b>	<b>Encoder 2: Encoder with measuring gear without valid signals</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	OFF1 (OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The encoder with measuring gear no longer provides any valid signals.
<b>Remedy:</b>	It must be ensured that all of the encoders, with mounted measuring gear, provide valid actual values in operation.

---

<b>F32503 (N, A)</b>	<b>Encoder 2: Position tracking cannot be reset</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The position tracking for the measuring gear cannot be reset.
<b>Remedy:</b>	The fault should be resolved as follows: - select encoder commissioning (p0010 = 4). - reset the position tracking as follows (p0411.2 = 1). - de-select encoder commissioning (p0010 = 0). The fault should then be acknowledged and the absolute encoder adjusted.

<b>F32802 (N, A)</b>	<b>Encoder 2: Time slice overflow</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A time slice overflow has occurred in encoder 2. Fault value (r0949, interpret hexadecimal): yx hex: y = function involved (Siemens-internal fault diagnostics), x = time slice involved x = 9: Time slice overflow of the fast (current controller clock cycle) time slice. x = A: Time slice overflow of the average time slice. x = C: Time slice overflow of the slow time slice. yx = 3E7: Timeout when waiting for SYNO (e.g. unexpected return to non-cyclic operation).
<b>Remedy:</b>	Increase the current controller sampling time Note: For a current controller sampling time = 31.25 µs, use an SMx20 with order number 6SL3055-0AA00-5xA3.

---

---

<b>F32805 (N, A)</b>	<b>Encoder 2: EEPROM checksum error</b>

<b>Reaction:</b>	OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	Internal parameter data is corrupted. Fault value (r0949, interpret hexadecimal): 01: EEPROM access error. 02: Too many blocks in the EEPROM.
<b>Remedy:</b>	Replace the module.

---

<b>F32850 (N, A)</b>	<b>Encoder 2: Encoder evaluation internal software error</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)
<b>Acknowledge:</b>	POWER ON
<b>Cause:</b>	An internal software error has occurred in the Sensor Module of encoder 2. Fault value (r0949, interpret decimal): 1: Background time slice is blocked. 2: Checksum over the code memory is not OK. 10000: OEM memory of the EnDat encoder contains data that cannot be interpreted. 11000 ... 11499: Descriptive data from EEPROM incorrect. 11500 ... 11899: Calibration data from EEPROM incorrect. 11900 ... 11999: Configuration data from EEPROM incorrect. 12000 ... 12008: communication with analog/digital converter faulted. 16000: DRIVE-CLiQ encoder initialization application error. 16001: DRIVE-CLiQ encoder initialization ALU error. 16002: DRIVE-CLiQ encoder HISI / SISI initialization error. 16003: DRIVE-CLiQ encoder safety initialization error. 16004: DRIVE-CLiQ encoder internal system error.
<b>Remedy:</b>	- replace the Sensor Module. - if required, upgrade the firmware in the Sensor Module. - contact Technical Support.

---

<b>F32899 (N, A)</b>	<b>Encoder 2: Unknown fault</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	A fault occurred on the Sensor Module for encoder 2 that cannot be interpreted by the Control Unit firmware. This can occur if the firmware on this component is more recent than the firmware on the Control Unit. Fault value (r0949, interpret decimal): Fault number. Note: If required, the significance of this new fault can be read about in a more recent description of the Control Unit.
<b>Remedy:</b>	- replace the firmware on the Sensor Module by an older firmware version (r0148). - upgrade the firmware on the Control Unit (r0018).

---

<b>F32905 (N, A)</b>	<b>Encoder 2: Parameterization error</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A parameter of encoder 2 was detected as being incorrect. It is possible that the parameterized encoder type does not match the connected encoder. The parameter involved can be determined as follows: - determine the parameter number using the fault value (r0949). - determine the parameter index (p0187).

## 4 Faults and alarms

### 4.2 List of faults and alarms

Fault value (r0949, interpret decimal):

yyyyxxxx dec: yyyy = supplementary information, xxxx = parameter

xxxx = 421:

For an EnDat/SSI encoder, the absolute position in the protocol must be less than or equal to 30 bits.

yyyy = 0:

No information available.

yyyy = 1:

The component does not support HTL level (p0405.1 = 0) combined with track monitoring A/B <> -A/B (p0405.2 = 1).

yyyy = 2:

A code number for an identified encoder has been entered into p0400, however, no identification was carried out. Please start a new encoder identification.

yyyy = 3:

A code number for an identified encoder has been entered into p0400, however, no identification was carried out. Please select a listed encoder in p0400 with a code number < 10000.

yyyy = 4:

This component does not support SSI encoders (p0404.9 = 1) without track A/B.

yyyy = 5:

For SQW encoder, value in p4686 greater than in p0425.

yyyy = 6:

DRIVE-CLiQ encoder cannot be used with this firmware version.

yyyy = 7:

For an SQW encoder, the Xact1 correction (p0437.2) is only permitted with equidistant zero marks.

yyyy = 8:

The motor pole pair width is not supported by the linear scale being used.

yyyy = 9:

The length of the position in the EnDat protocol may be a maximum of 32 bits.

yyyy = 10:

The connected encoder is not supported.

yyyy = 11:

The hardware does not support track monitoring.

#### Remedy:

- check whether the connected encoder type matches the encoder that has been parameterized.
- correct the parameter specified by the fault value (r0949) and p0187.
- re parameter number = 314:
- check the pole pair number and measuring gear ratio. The quotient of the "pole pair number" divided by the "measuring gear ratio" must be less than or equal to 1000 ((r0313 \* p0433) / p0432 <= 1000).

##### Cause:

The configuration for encoder 2 is incorrect.

Alarm value (r2124, interpret decimal):

1:

Re-parameterization between fault/alarm is not permissible.

419:

When the fine resolution Gx\_XIST2 is configured, the encoder identifies a maximum possible absolute position actual value (r0483) that can no longer be represented within 32 bits.

#### Remedy:

For alarm value = 1:

No re-parameterization between fault/alarm.

For alarm value = 419:

Reduce the fine resolution (p0419) or de-activate the monitoring (p0437.25), if the complete multiturn range is not required.

<b>A32930 (N)</b>	<b>Encoder 2: Data logger has saved data</b>
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	For the activated function "Data logger" (p0437.0 = 1) a fault has occurred with the Sensor Module. This alarm indicates that the diagnostics data corresponding to the fault was saved on the memory card. The diagnostics data is saved in the following folder: /USER/SINAMICS/DATA/SMTRC00.BIN ... /USER/SINAMICS/DATA/SMTRC07.BIN /USER/SINAMICS/DATA/SMTRCIDX.TXT The following information is contained in the TXT file: - Display of the last written BIN file. - Number of write operations that are still possible (from 10000 downwards). Note: Only Siemens can evaluate the BIN files.
<b>Remedy:</b>	Not necessary. The alarm disappears automatically. The data logger is ready to record the next fault case.

<b>F32950</b>	<b>Encoder 2: Internal software error</b>
<b>Message class:</b>	Hardware/software error (1)
<b>Reaction:</b>	OFF1 (OFF2)
<b>Acknowledge:</b>	POWER ON
<b>Cause:</b>	An internal software error has occurred. Fault value (r0949, interpret decimal): Information about the fault source. Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- if necessary, upgrade the firmware in the Sensor Module to a later version. - contact Technical Support.

---

<b>A32999 (F, N)</b>	<b>Encoder 2: Unknown alarm</b>
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	A alarm has occurred on the Sensor Module for encoder 2 that cannot be interpreted by the Control Unit firmware. This can occur if the firmware on this component is more recent than the firmware on the Control Unit. Alarm value (r2124, interpret decimal): Alarm number. Note: If required, the significance of this new alarm can be read about in a more recent description of the Control Unit.
<b>Remedy:</b>	- replace the firmware on the Sensor Module by an older firmware version (r0148). - upgrade the firmware on the Control Unit (r0018).

<b>F34851</b>	<b>VSM DRIVE-CLiQ (CU): Sign-of-life missing</b>
<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Reaction:</b>	NONE (OFF1, OFF2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A DRIVE-CLiQ communications error has occurred from the Voltage Sensing Module involved (VSM) to the Control Unit. The DRIVE-CLiQ component did not set the sign-of-life to the Control Unit. Fault cause: 10 (= 0A hex): The sign-of-life bit in the receive telegram is not set.

## 4 Faults and alarms

### 4.2 List of faults and alarms

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:** Upgrade the firmware of the component involved.

---

**F34860****VSM DRIVE-CLiQ (CU): Telegram error**

**Message class:** Internal (DRIVE-CLiQ) communication error (12)

**Reaction:** NONE (OFF1, OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communications error has occurred from the Voltage Sensing Module involved (VSM) to the Control Unit.

Fault cause:

1 (= 01 hex):

Checksum error (CRC error).

2 (= 02 hex):

Telegram is shorter than specified in the length byte or in the receive list.

3 (= 03 hex):

Telegram is longer than specified in the length byte or in the receive list.

4 (= 04 hex):

The length of the receive telegram does not match the receive list.

5 (= 05 hex):

The type of the receive telegram does not match the receive list.

6 (= 06 hex):

The address of the power unit in the telegram and in the receive list do not match.

9 (= 09 hex):

The error bit in the receive telegram is set.

16 (= 10 hex):

The receive telegram is too early.

17 (= 11 hex):

CRC error and the receive telegram is too early.

18 (= 12 hex):

The telegram is shorter than that specified in the length byte or in the receive list and the receive telegram is too early.

19 (= 13 hex):

The telegram is longer than that specified in the length byte or in the receive list and the receive telegram is too early.

20 (= 14 hex):

The length of the receive telegram does not match the receive list and the receive telegram is too early.

21 (= 15 hex):

The type of the receive telegram does not match the receive list and the receive telegram is too early.

22 (= 16 hex):

The address of the power unit in the telegram and in the receive list does not match and the receive telegram is too early.

25 (= 19 hex):

The error bit in the receive telegram is set and the receive telegram is too early.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:** - carry out a POWER ON (switch-off/switch-on).

- check the electrical cabinet design and cable routing for EMC compliance

- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

<b>F34875</b>	<b>VSM DRIVE-CLiQ (CU): Supply voltage failed</b>
<b>Message class:</b>	Supply voltage fault (undervoltage) (3)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The DRIVE-CLiQ communication from the DRIVE-CLiQ component involved to the Control Unit signals that the supply voltage has failed. Fault cause: 9 (= 09 hex): The power supply voltage for the components has failed. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): 0000yyxx hex: yy = component number, xx = error cause
<b>Remedy:</b>	- carry out a POWER ON (switch-off/switch-on). - check the power supply voltage wiring for the DRIVE-CLiQ component (interrupted cable, contacts, ...). - check the dimensioning of the power supply for the DRIVE-CLiQ component.
<hr/>	
<b>F34885</b>	<b>VSM DRIVE-CLiQ (CU): Cyclic data transfer error</b>
<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Reaction:</b>	NONE (OFF1, OFF2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A DRIVE-CLiQ communications error has occurred from the Voltage Sensing Module involved (VSM) to the Control Unit. The nodes do not send and receive in synchronism. Fault cause: 26 (= 1A hex): Sign-of-life bit in the receive telegram not set and the receive telegram is too early. 33 (= 21 hex): The cyclic telegram has not been received. 34 (= 22 hex): Timeout in the telegram receive list. 64 (= 40 hex): Timeout in the telegram send list. 98 (= 62 hex): Error at the transition to cyclic operation. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): 0000yyxx hex: yy = component number, xx = error cause
<b>Remedy:</b>	- check the power supply voltage of the component involved. - carry out a POWER ON. - replace the component involved. See also: p9915 (DRIVE-CLiQ data transfer error shutdown threshold master)
<hr/>	
<b>F34886</b>	<b>VSM DRIVE-CLiQ (CU): Error when sending DRIVE-CLiQ data</b>
<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Reaction:</b>	NONE (OFF1, OFF2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A DRIVE-CLiQ communications error has occurred from the Voltage Sensing Module involved (VSM) to the Control Unit. Data were not able to be sent. Fault cause: 65 (= 41 hex): Telegram type does not match send list. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): 0000yyxx hex: yy = component number, xx = error cause

**Remedy:** Carry out a POWER ON.

#### **F34887 VSM DRIVE-CLiQ (CU): Component fault**

**Message class:** Internal (DRIVE-CLiQ) communication error (12)

**Reaction:** NONE (OFF1, OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** Fault detected on the DRIVE-CLiQ component (Voltage Sensing Module) involved. Faulty hardware cannot be excluded.

Fault cause:

32 (= 20 hex):

Error in the telegram header.

35 (= 23 hex):

Receive error: The telegram buffer memory contains an error.

66 (= 42 hex):

Send error: The telegram buffer memory contains an error.

67 (= 43 hex):

Send error: The telegram buffer memory contains an error.

96 (= 60 hex):

Response received too late during runtime measurement.

97 (= 61 hex):

Time taken to exchange characteristic data too long.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

- check the electrical cabinet design and cable routing for EMC compliance

- if required, use another DRIVE-CLiQ socket (p9904).

- replace the component involved.

#### **F34895 VSM DRIVE-CLiQ (CU): Alternating cyclic data transfer error**

**Message class:** Internal (DRIVE-CLiQ) communication error (12)

**Reaction:** NONE (OFF1, OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communications error has occurred from the Voltage Sensing Module involved (VSM) to the Control Unit.

Fault cause:

11 (= 0B hex):

Synchronization error during alternating cyclic data transfer.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

Carry out a POWER ON.

See also: p9915 (DRIVE-CLiQ data transfer error shutdown threshold master)

---

#### **F34896 VSM DRIVE-CLiQ (CU): Inconsistent component properties**

**Message class:** Internal (DRIVE-CLiQ) communication error (12)

**Reaction:** OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** The properties of the DRIVE-CLiQ component (Voltage Sensing Module), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ cable or DRIVE-CLiQ component has been replaced.

Fault value (r0949, interpret decimal):

Component number.

**Remedy:**

- carry out a POWER ON.
- when a component is replaced, the same component type and if possible the same firmware version should be used.
- when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

**F35851 TM DRIVE-CLiQ (CU): Sign-of-life missing**

**Message class:** Internal (DRIVE-CLiQ) communication error (12)  
**Reaction:** OFF1 (OFF2)  
**Acknowledge:** IMMEDIATELY  
**Cause:** A DRIVE-CLiQ communication error has occurred from the Terminal Module involved (TM) to the Control Unit. The DRIVE-CLiQ component did not set the sign-of-life to the Control Unit.  
 Fault cause:  
 10 (= 0A hex):  
 The sign-of-life bit in the receive telegram is not set.  
 Note regarding the message value:  
 The individual information is coded as follows in the message value (r0949/r2124):  
 0000yyxx hex: yy = component number, xx = error cause

**Remedy:** Upgrade the firmware of the component involved.

**F35875 TM DRIVE-CLiQ (CU): Supply voltage failed**

**Message class:** Supply voltage fault (undervoltage) (3)

**Reaction:** OFF1 (OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** The DRIVE-CLiQ communication from the DRIVE-CLiQ component involved to the Control Unit signals that the supply voltage has failed.

Fault cause:

9 (= 09 hex):

The power supply voltage for the components has failed.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
  - check the power supply voltage wiring for the DRIVE-CLiQ component (interrupted cable, contacts, ...).

**Message class:** Internal (DRIVE-CLiQ) communication error (12)

**Reaction:** OFF1 (OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communication error has occurred from the Terminal Module involved (TM) to the Control Unit.

The nodes do not send and receive in synchronism.

Fault cause:

26 (= 1A hex):

Sign-of-life bit in the receive telegram not set and the receive telegram is too early.

33 (= 21 hex):

The cyclic telegram has not been received.

34 (= 22 hex):

Timeout in the telegram receive list.

64 (= 40 hex):

Timeout in the telegram send list.

98 (= 62 hex):

Error at the transition to cyclic operation.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- check the power supply voltage of the component involved.
  - carry out a POWER ON.
  - replace the component involved.

<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The properties of the DRIVE-CLiQ component (DRIVE-CLiQ Hub Module), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ cable or DRIVE-CLiQ component has been replaced. Fault value (r0949, interpret decimal): Component number.
<b>Remedy:</b>	- carry out a POWER ON. - when a component is replaced, the same component type and if possible the same firmware version should be used. - when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).
<b>F40799</b>	<b>CX32: Configured transfer end time exceeded</b>
<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The configured transfer end time when transferring the cyclic actual values was exceeded.
<b>Remedy:</b>	- carry out a POWER ON (switch-off/switch-on) for all components. - contact Technical Support.
<b>F40820</b>	<b>CX32 DRIVE-CLiQ: Telegram error</b>
<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A DRIVE-CLiQ communications error has occurred from the Control Unit to the controller extension involved. Fault cause: 1 (= 01 hex): Checksum error (CRC error). 2 (= 02 hex): Telegram is shorter than specified in the length byte or in the receive list. 3 (= 03 hex): Telegram is longer than specified in the length byte or in the receive list. 4 (= 04 hex): The length of the receive telegram does not match the receive list. 5 (= 05 hex): The type of the receive telegram does not match the receive list. 6 (= 06 hex): The address of the component in the telegram and in the receive list do not match.

## 4 Faults and alarms

### 4.2 List of faults and alarms

7 (= 07 hex):

A SYNC telegram is expected - but the received telegram is not a SYNC telegram.

8 (= 08 hex):

No SYNC telegram is expected - but the received telegram is one.

9 (= 09 hex):

The error bit in the receive telegram is set.

16 (= 10 hex):

The receive telegram is too early.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).

- check the electrical cabinet design and cable routing for EMC compliance

- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

#### **F40825**

#### **CX32 DRIVE-CLiQ: Supply voltage failed**

**Message class:**

Supply voltage fault (undervoltage) (3)

**Reaction:**

OFF1 (OFF2)

**Acknowledge:**

IMMEDIATELY

**Cause:**

The DRIVE-CLiQ communication from the DRIVE-CLiQ component involved to the Control Unit signals that the supply voltage has failed.

Fault cause:

9 (= 09 hex):

The power supply voltage for the components has failed.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).

- check the supply voltage wiring of the DRIVE-CLiQ component (interrupted cable, contacts, ...).

- check the dimensioning of the DRIVE-CLiQ component power supply.

#### **F40835**

#### **CX32 DRIVE-CLiQ: Cyclic data transfer error**

**Message class:**

Internal (DRIVE-CLiQ) communication error (12)

**Reaction:**

OFF2

**Acknowledge:**

IMMEDIATELY

**Cause:**

A DRIVE-CLiQ communications error has occurred from the Control Unit to the controller extension involved. The nodes do not send and receive in synchronism.

Fault cause:

33 (= 21 hex):

The cyclic telegram has not been received.

34 (= 22 hex):

Timeout in the telegram receive list.

64 (= 40 hex):

Timeout in the telegram send list.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).

- replace the component involved.

<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A DRIVE-CLiQ communications error has occurred from the controller extension involved to the Control Unit. The DRIVE-CLiQ component did not set the sign-of-life to the Control Unit. Fault cause: 10 (= 0A hex): The sign-of-life bit in the receive telegram is not set. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): 0000yyxx hex: yy = component number, xx = error cause
<b>Remedy:</b>	Upgrade the firmware of the component involved.

**F40886 CX32 DRIVE-CLiQ (CU): Error when sending DRIVE-CLiQ data**

**Message class:** Internal (DRIVE-CLiQ) communication error (12)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** A DRIVE-CLiQ communications error has occurred from the controller extension involved to the Control Unit.  
Data were not able to be sent.  
Fault cause:  
65 (= 41 hex):  
Telegram type does not match send list.

## 4 Faults and alarms

### 4.2 List of faults and alarms

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:** Carry out a POWER ON (switch-off/switch-on).

#### **F40887 CX32 DRIVE-CLiQ (CU): Component fault**

**Message class:** Internal (DRIVE-CLiQ) communication error (12)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** Fault detected on the DRIVE-CLiQ component concerned. Faulty hardware cannot be excluded.

Fault cause:

32 (= 20 hex):

Error in the telegram header.

35 (= 23 hex):

Receive error: The telegram buffer memory contains an error.

66 (= 42 hex):

Send error: The telegram buffer memory contains an error.

67 (= 43 hex):

Send error: The telegram buffer memory contains an error.

96 (= 60 hex):

Response received too late during runtime measurement.

97 (= 61 hex):

Time taken to exchange characteristic data too long.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).
- check the electrical cabinet design and cable routing for EMC compliance
- if required, use another DRIVE-CLiQ socket (p9904).
- replace the component involved.

---

#### **F40895 CX32 DRIVE-CLiQ (CU): Cyclic data transfer error**

**Message class:** Internal (DRIVE-CLiQ) communication error (12)

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communications error has occurred from the controller extension involved to the Control Unit.

Fault cause:

11 (= 0B hex):

Synchronization error during alternating cyclic data transfer.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:** Carry out a POWER ON (switch-off/switch-on).

See also: p9915 (DRIVE-CLiQ data transfer error shutdown threshold master)

---

#### **A50001 (F) PROFINET configuration error**

**Message class:** Communication error to the higher-level control system (9)

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A PROFINET controller attempts to establish a connection using an incorrect configuring telegram. The "Shared Device" function has been activated (p8929 = 2).

Alarm value (r2124, interpret decimal):

10: A/F-CPU configures mixed PZD/PROFIsafe telegram.

13: F-CPU and PROFIsafe is not activated (p9601.3).

15: PROFIsafe telegram of the F-CPU does not match the setting in p9501.30.

See also: p9601 (SI enable functions integrated in the drive (processor 1))

**Remedy:** Check the configuration of the PROFINET controllers as well as the p8929 setting.

---

**A50010 (F) PROFINET: Consistency error affecting adjustable parameters**  
**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** A consistency error was detected when activating the configuration (p8925) for the PROFINET interface. The currently set configuration has not been activated.  
Alarm value (r2124, interpret decimal):  
0: general consistency error  
1: error in the IP configuration (IP address, subnet mask or standard gateway).  
2: Error in the station names.  
3: DHCP was not able to be activated, as a cyclic PROFINET connection already exists.  
4: a cyclic PROFINET connection is not possible as DHCP is activated.  
Note:  
DHCP: Dynamic Host Configuration Protocol  
See also: p8920 (PN Name of Station), p8921 (PN IP address), p8922 (PN Def Gateway), p8923 (PN Subnet Mask), p8924 (PN DHCP Mode)  
**Remedy:** - check the required interface configuration (p8920 and following), correct if necessary, and activate (p8925).  
or  
- Reconfigure the station via the "Edit Ethernet node" screen form (e.g. with STARTER commissioning software).  
See also: p8925 (PN interface configuration)

---

**A50011 (F) Ethernet/IP: configuration error**  
**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** An EtherNet/IP controller attempts to establish a connection using an incorrect configuring telegram. The telegram length set in the controller does not match the parameterization in the drive device.  
**Remedy:** Check the set telegram length.  
For p0922 not equal to 999, then the length of the selected telegram applies.  
For p0922 = 999, the maximum interconnected PZD (r2067) applies.  
See also: p0922 (PROFIdrive PZD telegram selection), r2067 (PZD maximum interconnected)

---

**A50020 (F) PROFINET: Second controller missing**  
**Message class:** Communication error to the higher-level control system (9)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The PROFINET function "Shared Device" has been activated (p8929 = 2). However, only the connection to a PROFINET controller is present.  
**Remedy:** Check the configuration of the PROFINET controllers as well as the p8929 setting.

---

**F50510 FBLOCKS: Logon of the run-time group rejected**  
**Message class:** General drive fault (19)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** When the run-time groups of the free function blocks attempted to log on with the sampling time management, the logon of at least one run-time group was rejected.  
Too many different hardware sampling times may have been assigned to the free function blocks.  
**Remedy:** - check number of available hardware sampling times ( $T_{\text{sample}} < 8 \text{ ms}$ ) (r7903).

---

**F50511 FBLOCKS: Memory no longer available for free function blocks**  
**Message class:** General drive fault (19)  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** When the free function blocks were activated, more memory was requested than was available on the Control Unit.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:** Not necessary.

---

**A50513 (F) FBLOCKS: Run sequence value already assigned**  
**Message class:** General drive fault (19)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** An attempt was made to assign a run sequence value already assigned to a function block on this drive object to another additional function block on the same drive object. A run sequence value can only be precisely assigned to one function block on one drive object.  
**Remedy:** Set another value that is still available on this drive object for the run sequence.

---

**A50517 FBLOCKS: Int. meas. active**  
**Message class:** General drive fault (19)  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** A Siemens internal measurement has been activated.  
**Remedy:** Carry out a POWER ON (switch-off/switch-on) for the Control Unit involved.

---

**F50518 FBLOCKS: Sampling time of free run-time group differs at download**  
**Message class:** General drive fault (19)  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** In the STARTER/SCOUT project that was downloaded, the hardware sampling time of a free run-time group ( $1 \leq p20000[i] \leq 256$ ) was set to a value that was either too low or too high.  
The sampling time must be between 1 ms and the value  $r20003 - r20002$ .  
If the sampling time of the selected free run-time group is  $< 1$  ms, the equivalent value of 1 ms is used.  
If the value  $\geq r20003$ , then the sampling time is set to the next higher or the same software sampling time  $\geq r21003$ .  
Fault value (r0949, interpret decimal):  
Number of the p20000 index of the run-time group where the sampling time is incorrectly set.  
Number of the run-time group = fault value + 1  
**Remedy:**  
- correctly set the sampling time of the run-time group.  
- if required, take all of the blocks from the run-time group.  
Note:  
Fault F50518 only detects an incorrectly parameterized run-time group. If, after correcting p20000[i] in the project, this error occurs again at download, then the run-time group involved should be identified using the fault value (r0949) and the sampling time correctly set.

IVP	Internal Voltage Protection	Internal voltage protection
<b>J</b>		
JOG	Jogging	Jogging
<b>K</b>		
KDV	Kreuzweiser Datenvergleich	Data cross-check
KHP	Know-How Protection	Know-how protection
KIP	Kinetische Pufferung	Kinetic buffering
Kp	-	Proportional gain
KTY84	-	Temperature sensor
<b>L</b>		
L	-	Symbol for inductance
LED	Light Emitting Diode	Light emitting diode
LIN	Linearmotor	Linear motor
LR	Lageregler	Position controller
LSB	Least Significant Bit	Least Significant Bit
LSC	Line-side converter	Line-side converter

<b>Abbreviation</b>	<b>Source of abbreviation</b>	<b>Significance</b>
LSS	Line-Side Switch	Line-side switch
LU	Length Unit	Length unit
LWL	Lichtwellenleiter	Fiber-optic cable
<b>M</b>		
M	-	Symbol for torque
M	Masse	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as GND)
MB	Megabyte	Megabyte
MCC	Motion Control Chart	Motion Control Chart
MDI	Manual Data Input	Manual data input
MDS	Motor Data Set	Motor data set
MLFB	Maschinenlesbare Fabrikatebezeichnung	Machine-readable product code
MM	Motor Module	Motor Module
MMC	Man-Machine Communication	Man-machine communication
MMC	Micro Memory Card	Micro memory card
MSB	Most Significant Bit	Most significant bit
MSC	Motor Side Converter	Motor-side converter
MSCY_C1	Master Slave Cycle Class 1	Cyclic communication between master (class 1) and slave
MSC	Motorstromrichter	Motor-side converter
MT	Messtaster	Probe
<b>N</b>		
N. C.	Not Connected	Not connected
N...	No Report	No report or internal message
NAMUR	Normenarbeitsgemeinschaft für Mess- und Regeltechnik in der chemischen Industrie	Standardization association for measurement and control in chemical industries

PE	Protective Earth	Protective ground
PELV	Protective Extra-Low Voltage	Safety extra-low voltage
PFH	Probability of dangerous failure per hour	Probability of dangerous failure per hour
PG	Programmiergerät	Programming device
PI	Proportional integral	Proportional integral
PID	Proportional integral differential	Proportional integral differential
PLC	Programmable Logic Controller	Programmable logic controller
PLL	Phase-locked loop	Phase-locked loop
PM	Power Module	Power Module
PMSM	Permanent-Magnet Synchronous Motor	Permanent-magnet synchronous motor
PN	PROFINET	PROFINET
PNO	PROFIBUS Nutzerorganisation	PROFIBUS user organization
PPI	Point-to-Point Interface	Point-to-point interface
PRBS	Pseudo Random Binary Signal	White noise
PROFIBUS	Process Field Bus	Serial data bus
PS	Power Supply	Power supply
PSA	Power Stack Adapter	Power Stack Adapter
PT1000	-	Temperature sensor
PTC	Positive Temperature Coefficient	Positive temperature coefficient
PTP	Point-To-Point	Point-to-point
PWM	Pulse Width Modulation	Pulse width modulation
PZD	Prozessdaten	Process data
<b>Q</b>		
<b>R</b>		
r...	-	Display parameters (read only)
RAM	Random Access Memory	Speicher zum Lesen und Schreiben
RCCB	Residual Current Circuit Breaker	Residual current operated circuit breaker
RCD	Residual Current Device	Residual current operated circuit breaker
RCM	Residual Current Monitor	Residual current monitor
REL	Reluctance motor textile	Reluctance motor textile
RESM	Reluctance Synchronous Motor	Synchronous reluctance motor
RFG	Ramp-Function Generator	Ramp-function Generator

<b>Abbreviation</b>	<b>Source of abbreviation</b>	<b>Significance</b>
RJ45	Registered Jack 45	Term for an 8-pin socket system for data transmission with shielded or non-shielded multi-wire copper cables
RKA	Rückkühlanlage	Cooling unit
RLM	Renewable Line Module	Renewable Line Module
RO	Read Only	Read only
ROM	Read-Only Memory	Read-only memory
RPDO	Receive Process Data Object	Receive Process Data Object
RS232	Recommended Standard 232	Interface standard for a cable-connected serial data transmission between a sender and receiver (also known as EIA232)
RS485	Recommended Standard 485	Interface standard for a cable-connected differential, parallel, and/or serial bus system (data transmission between a number of senders and receivers, also known as EIA485)
RTC	Real-Time Clock	Real-time clock
RZA	Raumzeigerapproximation	Space-vector approximation
<b>S</b>		
S1	-	Continuous operation
S3	-	Intermittent duty
SAM	Safe Acceleration Monitor	Safe acceleration monitoring
SBC	Safe Brake Control	Safe brake control
SBH	Sicherer Betriebshalt	Safe operating stop
SBR	Safe Brake Ramp	Safe brake ramp monitoring
SBT	Safe Brake Test	Safe brake test
SCA	Safe Cam	Safe cam
SCC	Safety Control Channel	Safety Control Channel
SD Card	SecureDigital Card	Secure digital memory card
SDC	Standard Drive Control	Standard Drive Control
SDI	Safe Direction	Safe motion direction
SE	Sicherer Software-Endschalter	Safe software limit switch
SESM	Separately Excited Synchronous Motor	Separately excited synchronous motor
SG	Sicher reduzierte Geschwindigkeit	Safely-limited speed
SGA	Sicherheitsgerichteter Ausgang	Safety-related output
SGE	Sicherheitsgerichteter Eingang	Safety-related input
SH	Sicherer Halt	Safe stop
SI	Safety Integrated	Safety Integrated
SIC	Safety Info Channel	Safety Info Channel
SIL	Safety Integrity Level	Safety Integrity Level
